Fundamentals of Nursing Delmar Thomson Learning

Christopher Collins introduces an exciting new field of research traversing evolutionary biology, anthropology, archaeology, cognitive psychology, linguistics, neuroscience, and literary study. Paleopoetics maps the selective processes that originally shaped the human genus millions of years ago and prepared the human brain to play, imagine, empathize, and engage in fictive thought as mediated by language. A manifestation of the "cognitive turn" in the humanities, Paleopoetics calls for a broader, more integrated interpretation of the reading experience, one that restores our connection to the ancient methods of thought production still resonating within us. Speaking with authority on the scientific aspects of cognitive poetics, Collins proposes reading literature using cognitive skills that predate language and writing. These include the brain's capacity to perceive the visible world, store its images, and retrieve them later to form simulated mental events. Long before humans could share stories through speech, they perceived, remembered, and imagined their own inner narratives. Drawing on a wide range of evidence, Collins builds an evolutionary bridge between humans' development of sensorimotor skills and their achievement of linguistic cognition, bringing current scientific perspective to such issues as the structure of narrative, the distinction between metaphor and metonymy, the relation of rhetoric to poetics, the relevance of performance theory to reading, the difference between orality and writing, and the nature of play and imagination.

Multimedia services involve processing, transmission and retrieval of multiple forms of information. Multimedia services have gained momentum in the past few years due to the easy availability of computing power and storage media.

Society is demanding human-like intelligent behaviour, such as adaptation and generalization, from machines every day. With this view in mind, researchers are working on fusing intelligent paradigms such as artificial neural networks, swarm intelligence, artificial immune systems, evolutionary computing and multiagents with multimedia services. Artificial neural networks use neurons, interconnected using various schemes, for fusing learning in multimedia-based systems. Evolutionary computing techniques are used in tasks such as optimization. Typical multiagent systems are based on Belief-Desire-Intention model and act on behalf of the users. Typical examples of intelligent multimedia services include digital libraries, e-learning and teaching, e-government, e-commerce, e-entertainment, e-health and e-legal services. This book includes 15 chapters on advanced tools and methodologies pertaining to the multimedia services. The authors and reviewers have contributed immensely to this research-oriented book. We believe that this research volume will be valuable to professors, researchers and students of all disciplines, such as computer science, engineering and management. We express our sincere thanks to Springer-Verlag for their wonderful editorial support.
