The Bohensky Dissection Series has been used successfully by more than 300,000 biology students nationwide. Each book in the series is designed to guide the student through the study of anatomical structures. The books do this through the use of clearly marked photographs and illustrations. Accompanying text offers the student both easy-to-follow dissection instructions and factual information about the section under observation. At the end of each chapter there are tests which can be used for self-study or for grade course evaluation. Within the traditional dissection portion of a biology course, many programs include the sheep heart, eye, and brain. Within many of these guides, the author has incorporated photographs of these structures to more closely follow standard course curriculum. The author also provides important information on human organs such as the eye, ear, and heart. In this way, the student can better understand the role and function of these organs as they relate to human life processes. Add to this each book's large-size format, lay-flat spiral binding, and reasonable cost, and you can see why the Bohensky Dissection Series has become one of the most successful dissection guides used throughout this country's schools.

This is a lab manual for a college-level human anatomy course. Mastery of anatomy requires a fair amount of memorization and recall skills. The activities in this manual encourage students to engage with new vocabulary in many ways, including grouping key terms, matching terms to structures, recalling definitions, and written exercises. Most of the activities in this manual utilize anatomical models, and several dissections of animal tissues and histological examinations are also included. Each unit includes both pre- and post-lab questions and six lab exercises designed for a classroom where students move from station to station. The vocabulary terms used in each unit are listed at the end of the manual and serve as a checklist for practicals.

"Fascinating. Doidge's book is a remarkable and hopeful portrait of the endless adaptability of the human brain."—Oliver Sacks, MD, author of *The Man Who Mistook His Wife for a Hat* What is neuroplasticity? Is it possible to change your brain? Norman Doidge's inspiring guide to the new brain science explains all of this and more An astonishing new science called neuroplasticity is overthrowing the centuries-old notion that the human brain is immutable, and proving that it is, in fact, possible to change your brain. Psychoanalyst, Norman Doidge, M.D., traveled the country to meet both the brilliant scientists championing neuroplasticity, its healing powers, and the people whose lives they've transformed—people whose mental limitations, brain damage or brain trauma were seen as unalterable. We see a woman born with half a brain that rewired itself to work as a whole, blind people who learn to see, learning disorders cured, IQs raised, aging brains rejuvenated, stroke patients learning to speak, children with cerebral palsy learning to move with more grace, depression and anxiety disorders successfully treated, and lifelong character traits changed. Using these marvelous stories to probe mysteries of the body, emotion, love, sex, culture, and education, Dr. Doidge has written an immensely moving, inspiring book that will permanently alter the way we look at our brains, human nature, and human potential.

Purpose of study : The need for enrichment programs that exposes a diverse population of youth to health careers, is key to meeting national goals in helping eliminate health disparities. In this report, we describe the effectiveness of a unique and highly interactive enrichment program in garnering the interest of a diverse population of middle school students towards a career in the health field. Methods : To give youth a glimpse of life in medical school, we designed a structured program during the academic calendar that mimics the medical school's interactive curriculum. The workshops included but were not limited to lab practical's on human brain anatomy and sheep heart dissection, nutrition lectures, clinical skills sessions, bedside ultrasound, and robotics. The students were accepted through an application process. Students were sought out by their teachers and by interest in the medical field. We encouraged participation of those underrepresented in medicine by collaborating with schools in underserved areas. A feedback survey was distributed at the end of the program to measure the effectiveness of the program in helping them with their future goals and professional development as well as the effectiveness of the workshops. A 5-point scale was used, 1=least effective or 5 most effective. Summary of results : During the 2014-2015 academic year, 95 middle school students participated in the program and 57% were underrepresented in medicine. Of 95, 85 (89%) completed evaluations were collected. The average rating of the workshops ranged from 3.3 to 5.0, with anatomy lab and the medical school tour each having the highest rating of 4.7. As a result of this program, students gave an average rating of 4.4 out of 5 regarding their motivation to pursue a career in medicine, and a rating of 4.35 for interest in serving the underserved. Conclusions : The Hippocrates Circle of Kaiser San Diego was very successful in promoting the interest of a diverse population of youth towards a career in medicine. Long-term follow-up of the participants' career choices is needed.
