You need to bleed the air out of the cooling system in your car. Air pockets – or hot spots – are dangerous; they can overheat, crack or warp any part of the engine where the air is trapped. Usually, replacing the coolant or servicing the cooling system in your vehicle can lead to hot spots in the system.

As for the circulating water in closed cooling system, cool water will enter the engine through the circulating pump and circulate through the engine. Hot water will exit at the water outlet on top of the manifold and head to the heat exchanger to exchange the heat it's carrying with the raw water.
