Blackwell  
The MD Anderson  
Manual of Medical  
Oncology was  
designed to fill an

important void in  
oncology reference  
material by serving  
as a hands-on  
resource for the  
practicing  
oncologist. It was  
written exclusively  
by MD Anderson  
faculty and fellows  
with the idea of  
presenting a bird's  
eye view of medical  
oncology as it is  
currently practiced  
at that institution.

---

<p>While definitely written from the perspective of the medical oncologist, this book clearly emphasizes MD Anderson's multidisciplinary approach to cancer care. Furthermore, while evidence-based rationales are given for patient care strategies, no apologies are offered for articulating the unique perspectives and biases as they apply to cancer biology and therapy as practiced at this top-rated cancer center. The rationales for ongoing clinical trials are clearly articulated as well as the importance of ongoing clinical investigation. The</p>	<p>authors have filled the book with tables, graphics, relevant pathology figures, and other illustrative images, making it visually stimulating. Flowchart and diagrammatic algorithms are supplied to provide readers with a practical guide to the diagnostic and therapeutic strategies used at MD Anderson. Numerous chapters address important palliative and supportive measures, such as oncologic emergencies, infections, endocrine manifestations of non-endocrine tumors, palliation, and long-term followup.</p> <p><b>Student's Solutions</b></p>

For many years, we have  
noticed the lack of a concise,  
yet comprehensive,  
"question-and-answer style"  
book that thoroughly covers  
hematology,

hematolymphoid neoplasms,  
and coagulation disorders  
and renders them in an easy  
and digestible manner to the  
busy hematopathologists  
and fellows in training.

There are many excellent  
textbooks written by experts  
in the field, which are  
indispensable. However,  
and for sake of board exam  
cramming, these may not be  
the preferred source for  
studying. Most of the  
available hematology

question books are case series-molecular genetics. This is in based, and the authors refrain from following or maintaining a board-exam style. Our Hematopathology Q Bank: Board-Style Review will be the first Q bank in the field that comprehensively covers adult and pediatric disorders in hematology, hematopathology, and coagulation subspecialties. The book falls in eleven chapters and includes 380 written questions (without images), 230 question with high-resolution images, nearly 100 short case series and case studies, and 40 tables, charts, and algorithms. The contents cover both benign (reactive) and neoplastic conditions in hematopoietic and lymphoid systems, hematology-related cytology and FNA challenging cases, flow cytometry, cytogenetics, and addition to coagulation disorders and some laboratory management. The bank is full of interpretation rules and differential-diagnosis tables and fact sheets for easy board cramming. Materials have been derived from up-to-date textbooks including the revised fourth edition of WHO classification of hematopoietic and lymphoid tumors, articles, and real-time cases encountered in the laboratory. It is our sincere hope that this hematopathology review book fills a gap in field, and that hematopathology fellows in training and attending clinical pathologists find it a wealth of up-to-date information presented in an easy way. We hope they find this "Q bank" of utmost benefit in

In 1900, for every 1,000 babies born in the United States, 100 would die before their first birthday, often due to infectious diseases. Today, vaccines exist for many viral

and bacterial diseases. The National Childhood Vaccine Injury Act, passed in 1986, was intended to bolster vaccine research and development through the federal coordination of vaccine initiatives and to provide relief to vaccine manufacturers facing financial burdens. The legislation also intended to address concerns about the safety of vaccines by instituting a compensation program, setting up a passive surveillance system for vaccine adverse events, and by providing information to consumers. A key component of the legislation required the U.S. Department of Health and Human Services to collaborate with the Institute of Medicine to assess concerns about the safety of vaccines and potential adverse events, especially in children. Adverse Effects of Vaccines reviews the epidemiological, clinical, and biological evidence regarding adverse health events associated with specific vaccines covered by the

National Vaccine Injury Compensation Program (VICP), including the varicella zoster vaccine, influenza vaccines, the hepatitis B vaccine, and the human papillomavirus vaccine, among others. For each possible adverse event, the report reviews peer-reviewed primary studies, summarizes their findings, and evaluates the epidemiological, clinical, and biological evidence. It finds that while no vaccine is 100 percent safe, very few adverse events are shown to be caused by vaccines. In addition, the evidence shows that vaccines do not cause several conditions. For example, the MMR vaccine is not associated with autism or childhood diabetes. Also, the DTaP vaccine is not associated with diabetes and the influenza vaccine given as a shot does not exacerbate asthma. Adverse Effects of Vaccines will be of special interest to the National Vaccine Program Office, the VICP, the Centers for Disease

Control and Prevention, vaccine safety researchers and manufacturers, parents, caregivers, and health professionals in the private and public sectors.
