Sponsored by the Adolescent Mental Health Initiative of the Annenberg Public Policy Center (APPC) of the University of Pennsylvania and the Annenberg Foundation Trust at Sunnylands Trust, *Treating and Preventing Adolescent Mental Health Disorders, Second Edition*, provides a major update since the first edition in 2005. It addresses the current state of knowledge about the major mental health disorders that emerge during adolescence, including updated DSM-5 diagnostic criteria. Here, six commissions established by the APPC and the Sunnylands Trust pool their expertise on adolescent anxiety, schizophrenia, substance use disorders, depression and bipolar disorders, eating disorders, and suicidal behavior in sections that thoroughly define each disorder, outline and assess available treatments, discuss prevention strategies, and suggest a research agenda based on what we know and don't yet know about these various conditions. Two additional behavioral disorders—gambling and internet addiction—are covered in this second edition. As a meaningful counterpoint to its primary focus on mental illness, the volume also incorporates the latest research from a seventh commission—on positive youth development—which addresses how we can fully prepare young people to be happy and successful throughout their lives. Concluding chapters discuss overarching issues regarding the behavioral and mental health of adolescents: overcoming the stigma of mental illness, the research, policy, and practice context for the delivery of evidence-based treatments, and the development of a more robust agenda to advance adolescent health. Integrating the work of eminent scholars in both psychology and psychiatry, this work will be an essential volume for academics and practicing clinicians and will serve as a wake-up call to mental health professionals and policy makers alike about the state of our nation's response to the needs of adolescents with mental disorders.

The field of cognitive psychology has expanded rapidly in recent years, with experts in affective and cognitive neuroscience revealing more about mammalian brain function than ever before. In contrast, psychological problems such as ADHD, autism, anxiety, and depression are on the rise, as are medical conditions such as diabetes, obesity, and autoimmune disorders. Why, in this era of unprecedented scientific self-knowledge, does there seem to be so much uncertainty about what human beings need for optimal development? *Evolution, Early Experience and Human Development* asserts that human development is being misshaped by government policies, social practices, and public beliefs that fail to consider basic human needs. In this pioneering volume, scientists from a range of disciplines theorize that the increase in conditions such as depression and obesity can be partially attributed to a disparity between the environments and conditions under which our mammalian brains currently develop and our evolutionary heritage. For example, healthy brain and emotional development depends to a significant extent upon caregiver availability and quality of care. These include practices such as breastfeeding, co-sleeping, and parental social support, which have waned in modern society, but nevertheless may be integral to healthy development. As the authors argue, without a more informed appreciation of the ideal conditions under which human brains/minds develop and function, human beings will continue to struggle with suboptimal mental and physical health, and as problems emerge psychological treatments alone will not be effective. The best approach is to recognize these needs at the outset so as to optimize child development. *Evolution, Early Experience and Human Development* puts forth a logical, empirically based argument regarding human mammalian needs for optimal development, based on research from anthropology, neurobiology, animal science, and human development. The result is a unique exploration of evolutionary approaches to human behavior that will support the advancement of new policies, new attitudes towards health, and alterations in childcare practices that will better promote healthy human development.

In this groundbreaking bestseller, Lundy Bancroft—a counselor who specializes in working with abusive men—uses his knowledge about how abusers think to help women recognize when they are being controlled or devalued, and to find ways to get free of an abusive relationship. He says he loves you. So...why does he do that? You've asked yourself this question again and again. Now you have the chance to see inside the minds of angry and controlling men—and change your life. In *Why Does He Do That?* you will learn about:

- The early warning signs of abuse
- The nature of abusive thinking
- Myths about abusers
- Ten abusive personality types
- The role of drugs and alcohol
- What you can fix, and what you can't
- And how to

get out of an abusive relationship safely “This is without a doubt the most informative and useful book yet written on the subject of abusive men. Women who are armed with the insights found in these pages will be on the road to recovering control of their lives.”—Jay G. Silverman, Ph.D.,

Discussion of the precise nature and position of boundaries between disciplines is nearly always counterproductive; the need is usually to cross them not to emphasize them. And any such discussion of the distinction between ethology and comparative psychology would today seem patently absurd. While there may be differences in outlook, no boundaries exist. But when Frank Beach started in research, that was not the case. Comparative psychology flourished in the United States whereas ethology was unknown. Beach started as a comparative psychologist and has always called himself either that or a behavioral endocrinologist. Yet, among the comparative psychologists of his generation, he has had closer links with the initially European ethologists than almost any other. He was indeed one of the editors of the first volume of *Behaviour*. That this should have been so is not surprising once one knows that his Ph. D. thesis concerned "The Neural Basis for Innate Behavior," that he used to sleep in the laboratory so that he could watch mother rats giving birth, and that in 1935 he was using model young to analyze maternal behavior. Furthermore, for nine years he worked in the American Museum of Natural History—in a department first named Experimental Biology and later, when Beach had saved it from extinction and become its chairman, the Department of Animal Behavior. It was in 1938, during Frank's time at the American Museum, that he was first introduced to Niko Tinbergen by Ernst Mayr.

Testing and diagnosis of hepatitis B (HBV) and C (HCV) infection is the gateway for access to both prevention and treatment services, and is a crucial component of an effective response to the hepatitis epidemic. Early identification of persons with chronic HBV or HCV infection enables them to receive the necessary care and treatment to prevent or delay progression of liver disease. Testing also provides an opportunity to link people to interventions to reduce transmission, through counselling on risk behaviors and provision of prevention commodities (such as sterile needles and syringes) and hepatitis B vaccination. These are the first WHO guidelines on testing for chronic HBV and HCV infection and complement published guidance by WHO on the prevention, care and treatment of chronic hepatitis C and hepatitis B infection. These guidelines outline the public health approach to strengthening and expanding current testing practices for HBV and HCV, and are intended for use across age groups and populations.

Whether the decision is to have unprotected sex, consent to surgery, have an extra piece of pie, or spend rather than save for retirement, risky decisions permeate our lives, and sometimes with disastrous consequences. How and why risk taking occurs has important implications. Yet many questions remain about how neurobiological, psychological, and socio-cultural factors influence decision-making. This book advances basic understanding and scientific theory about the brain mechanisms underlying risky decision by integrating findings from a number of disciplines, including development and cognitive psychology, brain sciences, law, behavioral economic, and addiction. The result is a rich scientific framework for understanding the causal mechanisms of risky decision making across the lifespan. Book jacket.

*Bioactive Marine Natural Products* is the first book available that covers all aspects of bioactive marine natural products. It fills the void in the literature for bioactive marine natural products. The book covers various aspects of marine natural products and it is hoped that all the major classes of bioactive compounds are included. Different classes of marine organisms and the separation and isolation techniques are discussed. The chemistry and biology of marine toxins, peptides, alkaloids, nucleosides and prostanoids are discussed in detail. Biological, toxicological and clinical evaluations are also dealt with to ensure that the book may be adopted at any stage by any practicing organic chemist or biologist, working in academia or in R and D divisions of pharmaceutical companies. Each chapter in the book includes an abstract to highlight the major points discussed in the text and concluding remarks are given. References to books, monographs, review articles and original papers are provided at the end of each chapter.

The many significant technological and medical advances of the 21st century cannot overcome the escalating risk posed to older adults by such stressors as pain, weakness, fatigue, depression, anxiety, memory and other cognitive deficits, hearing loss, visual impairment, isolation, marginalization, and physical and mental illness. In order to overcome these and other challenges, and to maintain as high a quality of life as possible, older adults and the professionals who treat them need to promote and develop the capacity for resilience, which is innate in all of us to some degree. The purpose of this book is to provide the current scientific theory, clinical guidelines, and real-world interventions with regard to resilience as a clinical tool. To that end, the book addresses such issues as concepts and operationalization of resilience; relevance of resilience to successful aging; impact of personality and genetics on resilience; relationship between resilience and motivation; relationship between resilience and survival; promoting resilience in long-term care; and the lifespan approach to resilience. By addressing ways in which the hypothetical and theoretical concepts of resilience can be applied in geriatric practice, *Resilience in Aging* provides inroads to the current knowledge and practice of resilience from the perspectives of physiology, psychology, culture, creativity, and economics. In addition, the book considers the impact of resilience on critical aspects of life for older adults such as

policy issues (e.g., nursing home policies, Medicare guidelines), health and wellness, motivation, spirituality, and survival. Following these discussions, the book focuses on interventions that increase resilience. The intervention chapters include case studies and are intended to be useful at the clinical level. The book concludes with a discussion of future directions in optimizing resilience in the elderly and the importance of a lifespan approach to aging.

This open access book covers all facets of entity-oriented search—where “search” can be interpreted in the broadest sense of information access—from a unified point of view, and provides a coherent and comprehensive overview of the state of the art. It represents the first synthesis of research in this broad and rapidly developing area. Selected topics are discussed in-depth, the goal being to establish fundamental techniques and methods as a basis for future research and development. Additional topics are treated at a survey level only, containing numerous pointers to the relevant literature. A roadmap for future research, based on open issues and challenges identified along the way, rounds out the book. The book is divided into three main parts, sandwiched between introductory and concluding chapters. The first two chapters introduce readers to the basic concepts, provide an overview of entity-oriented search tasks, and present the various types and sources of data that will be used throughout the book. Part I deals with the core task of entity ranking: given a textual query, possibly enriched with additional elements or structural hints, return a ranked list of entities. This core task is examined in a number of different variants, using both structured and unstructured data collections, and numerous query formulations. In turn, Part II is devoted to the role of entities in bridging unstructured and structured data. Part III explores how entities can enable search engines to understand the concepts, meaning, and intent behind the query that the user enters into the search box, and how they can provide rich and focused responses (as opposed to merely a list of documents)—a process known as semantic search. The final chapter concludes the book by discussing the limitations of current approaches, and suggesting directions for future research. Researchers and graduate students are the primary target audience of this book. A general background in information retrieval is sufficient to follow the material, including an understanding of basic probability and statistics concepts as well as a basic knowledge of machine learning concepts and supervised learning algorithms.

The Neurology of Eye Movements provides clinicians with a synthesis of current scientific information that can be applied to the diagnosis and treatment of disorders of ocular motility. Basic scientists will also benefit from descriptions of how data from anatomical, electrophysiological, pharmacological, and imaging studies can be directly applied to the study of disease. By critically reviewing such basic studies, the authors build a conceptual framework that can be applied to the interpretation of abnormal ocular motor behavior at the bedside. These syntheses are summarized in displays, new figures, schematics and tables. Early chapters discuss the visual need and neural basis for each functional class of eye movements. Two large chapters deal with the evaluation of double vision and systematically evaluate how many disorders of the central nervous system affect eye movements. This edition has been extensively rewritten, and contains many new figures and an up-to-date section on the treatment of abnormal eye movements such as nystagmus. A major innovation has been the development of an option to read the book from a compact disc, make use of hypertext links (which bridge basic science to clinical issues), and view the major disorders of eye movements in over 60 video clips. This volume will provide pertinent, up-to-date information to neurologists, neuroscientists, ophthalmologists, visual scientists, otalaryngologists, optometrists, biomedical engineers, and psychologists.

NOTE: NO FURTHER DISCOUNT FOR THIS PRINT PRODUCT -- OVERSTOCK SALE -- Significantly reduced list price This Surgeon General s Report details the causes and the consequences of tobacco use among youth and young adults by focusing on the social, environmental, advertising, and marketing influences that encourage youth and young adults to initiate and sustain tobacco use. This is the first time tobacco data on young adults as a discrete population have been explored in detail. The report also highlights successful strategies to prevent young people from using tobacco. This three volume set includes the following items: A booklet containing highlights from the 2012 Surgeon General s report on tobacco use among youth and teens ages 12 through 17 and young adults ages 18 through 26. This booklet provides an overview of tobacco use within this targeted age group. The second booklet is an Executive Summary with two messages. One message from for Kathleen Sebelius, Secretary of Health and Human Services and a second message from Howard Koh, Assistant Secretary of Health and contains a brief introduction to the set and summary and conclusions for each chapter contained in the final volume. The final volume contains over 800 pages of documentation, interwoven with text and data addressing the adverse health consequences of tobacco use by children and young adults. It includes research on a variety of topics, including nicotine addiction, trends in cigarette smoking among young adults, trends in smokeless tobacco use and cigar smoking over time, genetic factors in tobacco use among youth, and mass media influence on smoking to this age group to name a few. This third volume is rich with table data research findings to support the Surgeon General s concerns with America s use and tobacco.
