Analyzing maintenance as an integrated system with objectives, strategies and processes that need to be planned, designed, engineered, and controlled using statistical and optimization techniques, the theme of this book is the strategic holistic system approach for maintenance. This approach enables maintenance decision makers to view maintenance as a provider of a competitive edge not a necessary evil. Encompassing maintenance systems; maintenance strategic and capacity planning, planned and preventive maintenance, work measurements and standards, material (spares) control, maintenance operations and control, planning and scheduling, maintenance quality, training, and others, this book gives readers an understanding of the relevant methodology and how to apply it to real-world problems in industry. Each chapter includes a number exercises and is suitable as a textbook or a reference for a professionals and practitioners whilst being of interest to industrial engineering, mechanical engineering, electrical engineering, and industrial management students. It can also be used as a textbook for short courses on maintenance in industry. This text is the second edition of the book, which has four new chapters added and three chapters are revised substantially to reflect development in maintenance since the publication of the first edition. The new chapters cover reliability centered maintenance, total productive maintenance, e-maintenance and maintenance performance, productivity and continuous improvement.

The aircraft is only a transport mechanism for the payload, and all design decisions must consider payload first. Simply stated, the aircraft is a dust cover. "Fundamentals of Aircraft and Airship Design, Volume 1: Aircraft Design" emphasizes that the science and art of the aircraft design process is a compromise and that there is no right answer; however, there is always a best answer based on existing requirements and available technologies.

Collision Reconstruction Methodologies - Volume 7A - The last ten years have seen explosive growth in the technology available to the collision analyst, changing the way reconstruction is practiced in fundamental ways. The greatest technological advances for the crash reconstruction community have come in the realms of photogrammetry and digital media analysis. The widespread use of scanning technology has facilitated the implementation of powerful new tools to digitize forensic data, create 3D models and visualize and analyze crash vehicles and environments. The introduction of unmanned aerial systems and standardization of crash data recorders to the crash reconstruction community have enhanced the ability of a crash analyst to visualize and model the components of a crash reconstruction. Because of the technological changes occurring in the industry, many SAE papers have been written to address the validation and use of new tools for collision reconstruction. Collision Reconstruction Methodologies Volumes 1-12 bring together seminal SAE technical papers surrounding advancements in the crash reconstruction field. Topics featured in the series include: • Night Vision Study and Photogrammetry • Vehicle Event Data Recorders • Motorcycle, Heavy Vehicle, Bicycle and Pedestrian Accident Reconstruction The goal is to provide the latest technologies and methodologies being introduced into collision reconstruction - appealing to crash analysts, consultants and safety engineers alike.

Generic Tools, Specific Languages (GTSL) is an approach for developing tools and applications in a way that supports easier and more meaningful adaptation to specific domains. To achieve this goal, GTSL generalizes programming language IDEs to domains traditionally not addressed by languages and IDEs. At its core, GTSL represents applications as documents/programs/models expressed with suitable languages. Application functionality is provided through an IDE that is aware of the languages and their semantics. The IDE provides editing support, and also directly integrates domain-specific analyses and execution services. Applications and their languages can be adapted to increasingly specific domains using language engineering; this includes developing incremental extensions to existing languages or creating additional, tightly integrated languages. Language workbenches act as the foundation on which such applications are built. mbeddr is an extensible set of integrated languages for embedded software development built using the Generic Tools, Specific Languages approach.

Corruption, fake news, and the "informational autocracy" sustaining Putin in power After fading into the background for many years following the collapse of the Soviet Union, Russia suddenly has emerged as a new threat—at least in the minds of many Westerners. But Western assumptions about Russia, and in particular about political decision-making in Russia, tend to be out of date or just plain wrong. Under the leadership of Vladimir Putin since 2000, Russia is neither a somewhat reduced version of the Soviet Union nor a classic police state. Corruption is prevalent at all levels of government and business, but Russia's leaders pursue broader and more complex goals than one would expect in a typical kleptocracy, such as those in many developing countries. Nor does Russia fit the standard political science model of a "competitive authoritarian" regime; its parliament, political parties, and other political bodies are neither fakes to fool the West nor forums for bargaining among the elites. The result of a two-year collaboration between top Russian experts and Western political scholars, *Autocracy* explores the complex roles of Russia's presidency, security services, parliament, media and other actors. The authors argue that Putin has created an "informational autocracy," which relies more on media manipulation than on the comprehensive repression of traditional dictatorships. The fake news, hackers, and trolls that featured in Russia's foreign policy during the 2016 U.S. presidential election are also favored tools of Putin's domestic regime—along with internet restrictions, state television, and copious in-house surveys. While these tactics have been successful in the short run, the regime that depends on them already shows signs of age: over-centralization, a narrowing of information flows, and a reliance on informal fixers to bypass the bureaucracy. The regime's challenge will be to continue to block social modernization without undermining the leadership's own capabilities.

Buku ini menjelaskan tentang manajemen perawatan pada penggerak kapal ikan tradisonoal. Armada kapal ikan Indonesia memiliki sekitar 24.358 unit (sekitar 20%) yang memiliki ukuran antara 5 GT hingga 10 GT, dan umumnya menggunakan mesin penggerak diesel stasioner tipe outboard. Dalam pengoperasiannya, mesin diesel stasioner digunakan untuk menggerakkan baling-baling melalui sebuah poros. Untuk memastikan baling-baling dapat tercelup ke dalam air, mesin diesel stasioner harus diposisikan dengan kemiringan berkisar antara 5 ° hingga 40 ° . Namun, kondisi ini menyebabkan sistem pelumasan menjadi tidak optimal. Upaya untuk mengatasi masalah ini dilakukan melalui modifikasi sistem pelumasan mesin diesel stasioner. Selain itu, penjadwalan perawatan yang tepat juga menjadi faktor penting untuk memastikan pendapatan yang optimal.
