"SketchUp is software designed to accommodate your personal design process. (Too often it is your process that must accommodate software.) Start with massing and loose proportions, and then add detail as you go. Or, if you need to draw more accurately, SketchUp can accept exact dimensions or exchange precision data with industry standard CAD systems at any time. Unlike CAD, you can approach design problems at the level of abstraction that is appropriate to your design goals, even as they change throughout a project." - page 8. The problem with traditional 2D CAD is that you sometimes lose touch with the overall design because you are forced to think from the perspective of flat construction documents. The restrictions of the documentation requirements and the technical limitations of the software take priority over the design itself. Designing in 3D gives you the freedom to visualize how the project will look in real life. The design becomes the primary focus, and the construction documents become a by-product of the design. That is the way it should be. There are plenty of 3D design programs out there that automate much of the process of designing a building, but you sacrifice the design once again because you are forced to learn and abide by complicated technical processes in order to get the software to do what you want. Creating anything custom further complicates the process, or is simply not possible. Where SketchUp shines is in its ability to create accurate 3D models quickly in an easy-to-use interface without forcing users to learn complicated tools or workflows. SketchUp has a unique way of prioritizing the design, and LayOut provides the conduit to communicate your design on paper. In *SketchUp & LayOut for Architecture*, you'll learn a step-by-step workflow that will enable you to eliminate CAD from your workflow, focus on your design, and produce beautiful construction documents for each phase of design, including Schematic Design, Design Development, and Construction Documentation.
