Moral, Ethical, and Social Dilemmas in the Age of Technology: Theories and Practice John Wiley & Sons

The term digital divide is still used regularly to characterize the injustice associated with inequalities in access to information and communication technologies (ICTs). As the debate continues and becomes more sophisticated, more and more aspects of the distribution of ICTs are singled out as relevant to characterizations of the digital divide and of its moral status. The best way to articulate the digital divide is to relate it to other aspects of social and distributive justice, using a mixture of pre-existing theories within moral and political philosophy. These theories are complemented with contributions from sociology, communication studies, information systems, and a range of other disciplines. Information Technology and Social Justice presents conceptual frameworks for understanding and tackling digital divides. It includes information on access and skills, access and motivation, and other various levels of access. It also presents a detailed analysis of the benefits and value of access to ICTs.

The past decade has seen tremendous growth in the demand for biometrics and data security technologies in applications ranging from law enforcement and immigration control to online security. The benefits of biometrics technologies are apparent as they become important technologies for information security of governments, business enterprises, and individuals. At the same time, however, the use of biometrics has raised concerns as to issues of ethics, privacy, and the policy implications of its widespread use. The large-scale deployment of biometrics technologies in e-governance, e-security, and e-commerce has required that we launch an international dialogue on these issues, a dialogue that must involve key stakeholders and that must consider the legal, political, philosophical and cultural aspects of the deployment of biometrics technologies. The Third International Conference on Ethics and Policy of Biometrics and International Data Sharing was highly successful in facilitating such interaction among researchers, policymakers, consumers, and privacy groups. This conference was supported and funded as part of the RISE project in its ongoing effort to develop wide consensus and policy recommendations on ethical, medical, legal, social, cultural, and political concerns in the usage of biometrics and data security technologies. The potential concerns over the deployment of biometrics systems can be jointly addressed by developing smart biometrics technologies and by developing policies for the deployment of biometrics technologies that clearly demarcate conflicts of interest between stakeholders.

The SAGE Encyclopedia of Business Ethics and Society Cengage Learning

This book explores whether the new capabilities made possible by precision-strike technologies are reshaping approaches to international intervention. Since the end of the Cold War, US technological superiority has led to a more proactive and, some would argue, high risk approach to international military intervention. New technologies including the capacity to mount precision military strikes from high-level bombing campaigns and, more recently, the selective targeting of individuals from unmanned aerial vehicles (UAVs) have facilitated air campaigns, supported by Special Forces, without the commitment of large numbers of troops on the ground. Such campaigns include, for example, NATO's high-level aerial bombardment of Milosevic's

forces in Kosovo in 1999 and of Gaddafi's in Libya in 2011, and the US operation involving Special Forces against Osama Bin Laden. The development of UAVs and electronic data intercept technologies has further expanded the potential scope of interventions, for example against Islamic militants in the tribal areas of Pakistan. This volume examines three key and interrelated dimensions of these new precision-strike capabilities: (1) the strategic and foreign policy drivers and consequences; (2) the legal and moral implications of the new capabilities; and (3), the implications for decision-making at the strategic, operational and tactical levels. This book will be of much interest to students of war and technology, air power, international intervention, security studies and IR.
