An Approach to Modelling Software Evolution Processes describes formal software processes that effectively support software evolution. The importance and popularity of software evolution increase as more and more successful software systems become legacy systems. For one thing, software evolution has become an important characteristic in the software life cycle; for another, software processes play an important role in increasing efficiency and quality of software evolution. Therefore, the software evolution process, the inter-discipline of software process and software evolution, becomes a key area in software engineering. The book is intended for software engineers and researchers in computer science. Prof. Tong Li earned his Ph.D. in Software Engineering at De Montfort University, U.K.; he has published five monographs and over one hundred papers.

As future generation information technology (FGIT) becomes specialized and fragmented, it is easy to lose sight that many topics in FGIT have common threads and, because of this, advances in one discipline may be transmitted to others. Presentation of recent results obtained in different disciplines encourages this interchange for the advancement of FGIT as a whole. Of particular interest are hybrid solutions that combine ideas taken from multiple disciplines in order to achieve something more significant than the sum of the individual parts. Through such hybrid philosophy, a new principle can be discovered, which has the propensity to propagate throughout multifaceted disciplines. FGIT

2009 was the first mega-conference that attempted to follow the above idea of hybridization in FGIT in a form of multiple events related to particular disciplines of IT, conducted by separate scientific committees, but coordinated in order to expose the most important contributions. It included the following international conferences: Advanced Software Engineering and Its Applications (ASEA), Bio-Science and Bio-Technology (BSBT), Control and Automation (CA), Database Theory and Application (DTA), Disaster Recovery and Business Continuity (DRBC; published independently), Future Generation Communication and Networking (FGCN) that was combined with Advanced Communication and Networking (ACN), Grid and Distributed Computing (GDC), Multimedia, Computer Graphics and Broadcasting (MulGraB), Security Technology (SecTech), Signal Processing, Image Processing and Pattern Recognition (SIP), and u- and e-Service, Science and Technology (UNESST).

Software is pervasive, affecting every area of our life from our work to our entertainment. Yet, few of us understand exactly what it is and how it will affect our future. What we do know is the confusion and frustration we often feel over the changes brought on by technology. We suffer from software shock. Authors Roger Pressman and Russell Herron offer a solution. In clear, nontechnical language, they demystify this complicated technology. They trace the history of software technology and look at the people and corporate cultures that compose the software industry. They also offer a tantalizing view of the deeper impact that computers and software will have in the future, covering such topics as -- how our privacy can be invaded by hackers -- how our national security can be compromised by technoterrorists -- how small errors jeopardize our vital systems, like our telephone networks -- how teaching computers can revolutionize education -- how software can increase your professional and personal productivity -- how intelligent cars and software-based highways will make driving a hands-off experience. Software Shock will help technical and nontechnical readers -- and their families -- understand the importance of software and cope with the dangers and opportunities it brings to the world.
