Math Skills by Objectives teaches basic math skills and shows students how to apply the skills they have learned to their daily lives. This three-volume program is organized by learning objectives -- subskill by subskill -- so that both students and teachers know exactly what their goals are.

The evenly paced, methodical style of instruction develops student confidence and mastery so students never go on to a new subskill or skill unless they have mastered the previous one. Book 3 reviews the basic math operations taught in Book 1 but at a more advanced level.

The definitive introduction to game theory This comprehensive textbook introduces readers to the principal ideas and applications of game theory, in a style that combines rigor with accessibility. Steven Tadelis begins with a concise description of rational decision making, and goes on to discuss strategic and extensive form games with complete information, Bayesian games, and extensive form games with imperfect information. He covers a host of topics, including multistage and repeated games, bargaining theory, auctions, rent-seeking games, mechanism design, signaling games, reputation building, and information transmission games. Unlike other books on game theory, this one begins with the idea of rationality and explores its implications for multiperson decision problems through concepts like dominated strategies and rationalizability. Only then does it present the subject of Nash equilibrium and its derivatives. Game Theory is the ideal textbook for advanced undergraduate and beginning graduate students. Throughout, concepts and methods are explained using real-world examples backed by precise analytic material. The book features many important applications to economics and political science, as well as numerous exercises that focus on how to formalize informal situations and then analyze them.
