Linear algebra moves steadily to n vectors in m -dimensional space. We still want combinations of the columns (in the column space). We still get m equations to produce b (one for each row). Those equations may or may not have a solution. They always have a least-squares solution. The interplay of columns and rows is the heart of linear algebra.

32 A is singular when its third column w is a combination $cu + dv$ of the first columns. A typical column picture has b outside the plane of u, v, w . A typical row picture has the intersection line of two planes parallel to the third plane. Then no solution. 33 $w = (5, 7)$ is $5u + 7v$. Then $Ae = 7v$. Linearity
