Applications. About the Textbook. Early introduction of key concepts: Fundamental ideas of linear algebra are introduced within the first seven lectures, in the concrete setting of  $\mathbb{R}^n$ , then gradually examined from different points of view. Later, generalizations of these concepts appear as natural extensions of familiar ideas.

m. vector  $x = Db$  satisfies  $Ax = b$ . This proves that the equation  $Ax = b$  has a solution for each  $b$  in  $\mathbb{R}^m$ . By Theorem 4 in Section 1.4,  $A$  has a pivot position in each row.

32 A is singular when its third column  $w$  is a combination  $cu + dv$  of the first columns. A typical column picture has  $b$  outside the plane of  $u, v, w$ . A typical row picture has the intersection line of two planes parallel to the third plane. Then no solution. 33  $w = (5, 7)$  is  $5u + 7v$ . Then  $Ae$  equals  $7$ . Linearity

Linear algebra moves steadily to  $n$  vectors in  $m$ -dimensional space. We still want combinations of the columns (in the column space).

We still get  $m$  equations to produce  $b$  (one for each row). Those equations may or may not have a solution. They always have a least-squares solution. The interplay of columns and rows is the heart of linear algebra.
