A key concern of researchers involved in the creation and sharing of language resources is to attain maximum usability, reliability and longevity of these resources for present and future researchers in the language sciences. The view developed in this volume is that spoken corpora construction and sharing are major research endeavours that should also be laid open to academic debate in a manner that is more visible than is currently the case in corpus linguistics. The present volume brings together multiple research perspectives to bear on the question of what constitutes best practices for the construction of spoken corpora. The book brings into closer contact scholars whose specializations have often remained in relatively different streams of scientific investigation; that is, scholars whose work falls primarily in conversation analysis, pragmatics and discourse analysis, but who are involved in spoken corpus compilation, on the one hand, and scholars who also specialize in linguistics but who have been intensively involved in developing various infrastructures for spoken corpora, on the other hand. This combination of scholars brings into better relief the concerns of data providers, data curators and data users in linguistic research. This book is thus unique in that it highlights best practices from both the perspective of assembling, annotating and linguistic analysis of spoken corpora, as well as from the perspective of processing, archiving and disseminating spoken language. In doing so, the contributions emphasise not only the considerable promise that the rapid technological changes that society continues to experience in this area offer, but also possible dangers for the unwary.

A pragmatic approach to testing electronic systems As we move ahead in the electronic age, rapid changes in technology pose an ever-increasing number of challenges in testing electronic products. Many practicing engineers are involved in this arena, but few have a

chance to study the field in a systematic way-learning takes place on the job. By covering the fundamental disciplines in detail, Principles of Testing Electronic Systems provides design engineers with the much-needed knowledge base. Divided into five major parts, this highly useful reference relates design and tests to the development of reliable electronic products; shows the main vehicles for design verification; examines designs that facilitate testing; and investigates how testing is applied to random logic, memories, FPGAs, and microprocessors. Finally, the last part offers coverage of advanced test solutions for today's very deep submicron designs. The authors take a phenomenological approach to the subject matter while providing readers with plenty of opportunities to explore the foundation in detail. Special features include: * An explanation of where a test belongs in the design flow * Detailed discussion of scan-path and ordering of scan-chains * BIST solutions for embedded logic and memory blocks * Test methodologies for FPGAs * A chapter on testing system on a chip * Numerous references

Developing Linguistic Corpora Walter de Gruyter GmbH & Co KG

This book presents a detailed corpus-based study of adverbial subordinate clauses in English within the framework of the theory of Functional Grammar. On the basis of an in-depth data analysis, this study shows that there is a systematic correlation between the semantic types of adverbial clauses, on the one hand, and the verb forms by means of which these constructions are expressed in English, on the other. In contrast to most traditional classifications, the criterion used for the semantic classification of adverbial clauses is not simply the basic meaning of the conjunction introducing the subordinate clause. Instead, the present classification is based on the systematic and consistent application of four semantic parameters: Entity Type, Time Dependency, Factuality and Presupposition. The relevance of the application of these parameters is not only that they allow to establish a complete and exhaustive typology of adverbial clauses, but also that they form the basis for four implicational hierarchies that determine the distribution of expression formats along the different semantic types of adverbial clauses. This book also constitutes a contribution to the application of Functional Grammar to the corpus-based analysis of a specific language and, more specifically, to the validation of the hierarchical model of the structure of the

clause postulated within this theoretical framework.

This volume introduces the reader to the wide range of methods that digital humanities employ, and offers a practical guide to the study, interpretation, and presentation of cultural material and practices. In this instance, the editors consider digital humanities to include both the use of computing to understand cultural material in new ways, and the application of theories and methods from the humanities to interpret new technologies. Each chapter provides a step-by-step guide to cutting-edge methodologies so that students can make informed decisions about the methods they use, consider ethical practices, follow practical procedures, and present their work effectively. Readers will develop practical and reflexive understandings of the software and digital devices that they study and use for research, and the book will help new researchers collaborate and contribute to their scholarly communities, and to public discourse. As contemporary humanities work becomes increasingly interdisciplinary, and increasingly permeated by and with digital technologies, this volume helps new researchers navigate an evolving academic environment. Humanities and social sciences students will find this textbook an invaluable resource for assessing and creating digital projects.

The reconstruction of ancient Mesopotamian medical, ritual and omen compendia and their complex history is still characterised by many difficulties, debates and gaps due to fragmentary or unpublished evidence. This book offers the first complete edition of the Assur Medical Catalogue, an 8th or 7th century BCE list of therapeutic texts, which forms a core witness for the serialisation of medical compendia in the 1st millennium BCE. The volume presents detailed analyses of this and several other related catalogues of omen series and rituals, constituting the corpora of divination and healing disciplines. The contributions discuss links between catalogues and textual sources, providing new insights into the development of compendia between serialization, standardization and diversity of local traditions. Though its a novel corpus-based approach, this volume revolutionizes the current understanding of Mesopotamian medical texts and the healing disciplines of "conjurer" and

"physician". The research presented here allows one to identify core text corpora for these disciplines, as well as areas of exchange and borrowings between them.

Database System Concepts by Silberschatz, Korth and Sudarshan is now in its 6th edition and is one of the cornerstone texts of database education. It presents the fundamental concepts of database management in an intuitive manner geared toward allowing students to begin working with databases as quickly as possible. The text is designed for a first course in databases at the junior/senior undergraduate level or the first year graduate level. It also contains additional material that can be used as supplements or as introductory material for an advanced course. Because the authors present concepts as intuitive descriptions, a familiarity with basic data structures, computer organization, and a high-level programming language are the only prerequisites. Important theoretical results are covered, but formal proofs are omitted. In place of proofs, figures and examples are used to suggest why a result is true.

Teaching and Learning by Doing Corpus Analysis Cambridge University Press

This book is a critical appraisal of recent developments in corpus linguistics for the analysis of written and spoken learner data. The twelve papers cover an introductory critical appraisal of learner corpus data compilation and development (section 1); issues in data compilation, annotation and exchangeability (section 2); automatic approaches to data identification and analysis (section 3); and analysis of learner corpus data in the light of recent models of data analysis and interpretation, especially recent automatic approaches for the identification of learner language features (section 4). This collection is aimed at students and researchers of corpus linguistics, second language acquisition studies and quantitative linguistics. It will significantly advance learner corpus research in terms of methodological innovation and will fill in an important gap in the development of multidisciplinary approaches (for learner corpus studies).
