That is, the solutions of $Ax = 0$ are the vectors of the form $x = Nz$. In other words, the columns of N span the null space of A . One can also use the technique to solve inhomogeneous equations $Ax = b$. One simply applies the theory to the augmented matrix $[A \ b]$. There is a solution when the last column of A is not a pivot column. A particular solution

Applied mathematics is the application of mathematical

methods by different fields such as science, engineering, business, computer science, and industry. Thus, applied mathematics is a combination of mathematical science and specialized knowledge. The term "applied mathematics" also describes the professional specialty in which mathematicians work on practical problems by formulating and studying mathematical models. In the past, practical applications have motivated the development of mathemat

If $y = f(x)$ is a one-to-one function, then $f^{-1}(y)$ is also a one-to-one function. In this case, $x = f^{-1}(f(x)) = f^{-1}(f^{-1}(x))$ for values of x where both $f(x)$ and $f^{-1}(x)$ are defined. For example $\ln x$, which maps \mathbb{R}^+ to \mathbb{R} is the inverse of e^x . $x = \ln x = \ln(e^x)$ for all $x \in \mathbb{R}^+$.

Such equations arise, for example, as models of spatially nonuniform chemical reactions, and of population dynamics in spatially distributed species.
