In a joint effort between the National Academy of Engineering and the Institute of Medicine, this books attempts to bridge the knowledge/awareness divide separating health care professionals from their potential partners in systems engineering and related disciplines. The goal of this partnership is to transform the U.S. health care sector from an underperforming conglomerate of independent entities (individual practitioners, small group practices, clinics, hospitals, pharmacies, community health centers et. al.) into a high performance "system" in which every participating unit recognizes its dependence and influence on every other unit. By providing both a framework and action plan for a systems approach to health care delivery based on a partnership between engineers and health care professionals, [Building a Better Delivery System](#) describes opportunities and challenges to harness the power of systems-engineering tools, information technologies and complementary knowledge in social sciences, cognitive sciences and business/management to advance the U.S. health care system.

Socioeconomic conditions are known to be major determinants of health at all stages of life, from pregnancy through childhood and adulthood. "Life-course epidemiology" has added a further dimension to the understanding of the social determinants of health by showing an association between early-life socioeconomic conditions and adult health-related behaviors, morbidity, and mortality. Sensitive and critical periods of development, such as the prenatal period and early childhood, present significant opportunities to influence lifelong health. Yet simply intervening in the health system is insufficient to influence health early in the life course. Community-level approaches to affect key determinants of health are also critical. Many of these issues were raised in the 1995 National Academies book, [Children's Health, the Nation's Wealth](#). The present volume builds upon this earlier book with presentations and examples from the field. Focusing on [Children's Health](#) describes the evidence linking early childhood life conditions and adult health; discusses the contribution of the early life course to observed racial and ethnic disparities in health; and highlights successful models that engage both community factors and health care to affect life course development.

Maximizing reader insights into a new movement toward leadership approaches that are collaborated and shared, and which views Occupational Safety and Health (OSH) and performance excellence within the wider examination of leadership relationships and practices, this book argues that these relationships and processes are so central to the establishment of OSH functioning that studying them warrants a broad, cross-disciplinary, multiple method analysis. Exploring the complexity of leadership by the impact that contexts (e.g., national and organizational culture) may have on leaders, this book discusses the related literature, then moves forward to show how a more comprehensive practical approach to Occupational Safety and Health and performance excellence can function on levels pertaining to events, individuals, groups, and organizations. This book proposes that greater clarity in understanding leadership in Occupational Safety and Health and performance excellence can be developed from addressing two fundamental issues. Firstly, how do subunit inputs and processes combine to produce unit-level outcomes and how does leadership affect this process? Secondly, how do the leaders influence the way that individual-level inputs are combined to produce organizational outputs. In these issues, the alternative methodologies that allow precise measurement of organizational outputs in OSH and performance excellence are reviewed. To help readers navigate through the best practices, each chapter contains Question Guidelines, Exercises and Case studies which illustrate the concepts discussed and which serves to highlight the key evidence demonstrating that collaborative leadership can positively affect individual, group, and organizational level outcomes, including organizational OSH and performance excellence.
