Practical Problems in Financial Management by Dr. R. S. Kulshreshtha, Rakesh Kulshreshtha (SBPD Publications) Chandra Sekhar

The business environment, particularly after the continuing oil crises of the seventies, can be characterized as evolving rapidly in complex and often unpredictable ways. Such things as high interest and inflation rates, fluctuating exchange rates, volatile commodity markets, and increasing political turmoil have led to a situation in which explicit consideration of environmental dynamics is becoming much more important for successful business planning than was true in the past. Companies are finding that it is no longer possible to conduct "busi-

ness as usual" under these changing circumstances. Rather, decision makers are having to be more cognizant of the many sources of uncertainty that could have serious impacts on the continued prosperity of the firm, as well as of actions that can be taken so that the company can thrive in spite of these greater uncertainties. Businesses have responded to these challenges by giving more thorough consideration to strategic issues. Whereas in the past the steady progression of markets and technology was taken for granted, the uncertainties associated with increased worldwide competition, as well as with other exogenous factors, have forced companies to think more about flexibility. This

involves not only how best to exploit profitable current options, but also how to position themselves at present to be able to respond appropriately to threats and opportunities as they arise in the future. Unfortunately, in this redirection of outlook, the finance profession has not kept pace.

Federally owned capital assets include some 500,000 buildings and similar facilities worldwide acquired during 200 years of government operations. Government facilities are used to defend the national interest; conduct foreign policy; house historic, cultural and educational artifacts; pursue research; and provide services to the American public. These buildings and structures project an image of American government at home and abroad, contribute to the architectural and socioeconomic fabric of their communities, and support the organizational and individual performance of federal

employees conducting the business of government . Federal facilities embody significant investments and resources and therefore constitute a portfolio of public assets. At least 30 separate agencies manage these facilities. As stewards of this public investment, federal facilities program managers face a number of challenges. In the 1990s Congress and the Executive Branch took a number of initiatives to improve capital asset decision making in the federal government. These include enacting the Government Performance and Results Act of 1993, the Federal Acquisition Streamlining Act of 1994, the Clinger-Cohen Act of 1996 and a series of federal financial accounting standards; developing the Capital Programming Guide (1997); and

appointing the President's Commission to Study Capital Budgeting (1997). Senior and mid-level agency officials are now seeking ways to implement these initiatives efficiently and effectively. The Federal Facilities Council (FFC) sponsored a conference entitled "Capital Asset Management: Tools and Strategies For Decision Making" to highlight strategies and ideas for capital asset management so that federal and other public agencies can improve decision making for facilities investment. Held at the National Academy of Sciences in Washington, D.C., on September 13, 2000, the conference featured speakers from the public, non-profit, and private sectors. *Capital Asset Management: Tools and Strategies For Decision Making: Conference*

Proceedings summarizes the presentations made at that conference. The speakers focused on trends and best practices in capital budgeting; capital asset decision making processes in three federal agencies; building a case for capital reinvestment; and new tools for federal agencies. Online resources referred to by the speakers are listed in Appendix A. Appendix B contains the speakers' biographies.

Excerpt from Procedures for Capital Budgeting Under Uncertainty Accordingly, the cost of capital is defined as the minimum expected rate of return on a

project (with given risk characteristics) such that share price is increased by the project's adoption. The cost of capital is thus used as a hurdle rate, with the height of the barrier depending on the risk characteristics of the project compared with those of alternative investments open to shareholders. It is easy to point out deficiencies in this "NPV approach" - for instance, most authors are conspicuously vague about how to measure the hurdle rates appropriate to projects with different risk characteristics. The important point for our purposes, however, is that the NPV approach presumes projects to be risk-independent. That is, it presumes that the value of project B does not depend on the risk characteristics of the firm's existing assets, or of other investments the firm may

undertake. 2. Treat capital budgeting as a problem of portfolio selection. - The framework for portfolio selection originally presented by Markowitz [10] [11] is now well-known and widely accepted, although difficulties in assembling data and performing the required calculations have limited its use in practice. The similarity between the tasks of portfolio selection and capital budgeting has led Lintner, among others, to conclude that "the problem of determining the best capital budget of any given size is formally identical to the solution of a security portfolio analysis."
