Who Votes Now? compares the demographic characteristics and political views of voters and nonvoters in American presidential elections since 1972 and examines how electoral reforms and the choices offered by candidates influence voter turnout. Drawing on a wealth of data from the U.S. Census Bureau's Current Population Survey and the American National Election Studies, Jan Leighley and Jonathan Nagler demonstrate that the rich

have consistently voted more than the poor for the past four decades, and that voters are substantially more conservative in their economic views than nonvoters. They find that women are now more likely to vote than men, that the gap in voting rates between blacks and whites has largely disappeared, and that older Americans continue to vote more than younger Americans. Leighley and Nagler also show how electoral reforms such as Election Day voter registration and absentee voting have boosted voter turnout, and how turnout would also rise if parties offered more distinct choices. Providing the most systematic analysis available of modern voter turnout, *Who Votes Now?* reveals that persistent class bias in turnout has enduring political consequences, and that it really does matter who votes and who doesn't.

Imperial Russian Foreign Policy aims to demythologise a field hitherto dominated by suspicions of diabolical cunning, inscrutable motives, and international plots using unseen forces of the gigantic, fear-inspiring empire of the tsar. The contributors, leading historians from both Russia and the West, examine Imperial foreign policy from its origins to the October Revolution, revealing a policy that, as in other countries, had a complex of motives - commerce, nationalism, the interests of various social groups - but an unusual origin, coming almost exclusively from the entourage of the tsar. The work is based largely on original research in Soviet archives, which only became possible after Soviet glasnost.

Developmental Neuroscience is one of the six core disciplines in Neuroscience, and yet no single volume, non-textbook reference exists on the market that provides researchers with more in-depth, high-level information on developmental neurobiology. Currently, anyone interested in the field at a higher level must sift through review articles published frequently and the more specific handbooks that focus on aspects of development rather than the field as a whole. This reference is the first of its kind to fill this need. It pulls together the relevant articles on the topic from the 10-volume Encyclopedia of Neuroscience (Academic Press, 2008) and serves as an affordable and immediate resource for scientists, postdocs, graduate students with an interest beyond the basic textbook materials on the subject. The first and only comprehensive, single-volume reference for developmental neuroscience that goes beyond the basic textbook information. The 93 chapters cover topics

ranging from cell fate determination, path finding, synapse generation, neural stem cells, to neurodegeneration and regeneration, carefully selected from the Encyclopedia of Neuroscience by one of the great developmental neuroscientists, Greg Lemke. The best researchers in the field provide their conclusions in the context of the latest experimental results. *Adult Psychopathology and Diagnosis* Thomson South-Western
