This is a portfolio of a mixed bag of events, and objects that have caught my eye and been recorded as of interest to me. Ilford ' s old slogan " For Faces and Places, " was very apt. It could take just sixty minutes to look through the book or you may want to look through sixty times who knows? It spans a sixty-year period of life which has passed by my lens. I have selected the most memorable ones, which are likely to mean more to viewers beyond the family circle so to speak. Photography can be so, so personal I have found. Many of these images can never be repeated. Some will stand the test of time better than others. I would like to think that British Amateur Photojournalism never dies and ordinary people such as myself can and will make the effort to continue recording for posterity. In black and white please, it has for me and many enthusiasts alike, an archaic charm that no other art form can beat.

Visual Perception and Control of Underwater Robots covers theories and applications from aquatic visual perception and underwater robotics. Within the framework of visual perception for underwater operations, image restoration, binocular measurement, and object detection are addressed. More specifically, the book includes adversarial critic learning for visual restoration, NSGA-II-based calibration for binocular measurement, prior knowledge refinement for object detection, analysis of temporal detection performance, as well as the effect of the aquatic data domain on object detection. With the aid of visual perception technologies, two up-to-date underwater robot systems are demonstrated. The first system focuses on underwater robotic operation for the task of object collection in the sea. The second is an untethered biomimetic robotic fish with a camera stabilizer, its control methods based on visual tracking. The authors provide a self-contained and comprehensive guide to understand underwater visual perception and control. Bridging the gap between theory and practice in underwater vision, the book features implementable algorithms, numerical examples, and tests, where codes are publicly available. Additionally, the mainstream technologies covered in the book include deep learning, adversarial learning, evolutionary computation, robust control, and underwater bionics. Researchers, senior undergraduate and graduate students, and engineers dealing with underwater visual perception and control will benefit from this work.
