Computer Vision Metrics provides an extensive survey and analysis of over 100 current and historical feature description and machine vision methods, with a detailed taxonomy for local, regional and global features. This book provides necessary background to develop intuition about why interest point detectors and feature descriptors actually work, how they are designed, with observations about tuning the methods for achieving robustness and invariance targets for specific applications. The survey is broader than it is deep, with over 540 references provided to dig deeper. The taxonomy includes search methods, spectra components, descriptor representation, shape, distance functions, accuracy, efficiency, robustness and invariance attributes, and more. Rather than providing ' how-to' source code examples and shortcuts, this book provides a counterpoint discussion to the many fine opencv community source code resources available for hands-on practitioners.

TENS, or transcutaneous electrical nerve stimulation, is a pain treatment that uses low voltage electric current to scramble pain signals in your body. TENS is typically done with a TENS unit, a small battery-operated device. The device can be hooked to a belt and is connected to two electrodes. The electrodes carry an electric current from the TENS machine to the skin. Starting with recommended placements and TENS settings I experimented with different units, their settings, and placements until I found the ideal solution for my two different types of pain, Peripheral Neuropathy, and Sciatica. At the same time, I had two knees which had gone past the time when they should have been reconstructed, but Queensland Health was in a bad state nine years ago, and still is, so I've developed a great pain relief method using my TENS, that really and truly works for me.
