Fifty years ago, a troop of Japanese macaques was observed washing sandy sweet potatoes in a stream, sending ripples through the fields of ethology, comparative psychology, and cultural anthropology.

The issue of animal culture has been hotly debated ever since. Now Kevin Laland and Bennett Galef have gathered key voices in the often rancorous debate to summarize the views along the continuum from “Culture? Of course!” to “Culture? Of course not!”

The result is essential reading for anyone interested in the validity of animal culture, and what it might say about our own.

Biologists and anthropologists in Japan have played a crucial role in the development of primatology as a scientific discipline. Publication of *Primate Origins of Human Cognition and Behavior* under the editorship of Tetsuro Matsuzawa reaffirms the pervasive and creative role played

by the intellectual descendants of Kinji Imanishi and Junichiro Itani in the fields of behavioral ecology, psychology, and cognitive science. Matsuzawa and his colleagues-humans and other primate partners- explore a broad range of issues including the phylogeny of perception and cognition; the origin of human speech; learning and memory; recognition of self, others, and species; society and social interaction; and culture. With data from field and laboratory studies of more than 90 primate species and of more than 50 years of long-term research, the intellectual breadth represented in this volume makes it a major contribution to

comparative cognitive science and to current views on the origin of the mind and behavior of humans.

Primate Origins of Human Cognition and Behavior
Springer Science & Business Media
Living in a world circumscribed by up-to-the-minute news and electronic tools we barely master before they are out-of-date, we attempt to shield ourselves from environmental events which threaten to

overturn our constructed reality. Naturally, in such fast-paced and topsy-turvy surroundings we watch the sky and earth for signs of regularity; looking to the changing seasons for hope and rejuvenation, and seeking out the voices of those who speak of constancy in the changes of the natural world. Hal Borland was such a voice. Every week, beginning in 1941, in the editorial pages of *The New York Times* he would speak of living on the land—this natural world we all try to understand. In this collection of 365 of his essays, arranged daily within the twelve months, he writes with a familiarity of the ways of the country that is at once humble and resiliently knowledgeable. In *Sundial of the Seasons*

you will find page-long ruminations on such topics as “Fog” (“a unique blend of mood and weather”), “The Bumblebee” (“Bumblebees tolerate man, up to a point”), “Dandelions” (“Neither flood nor drouth seems to discourage it”), and “Fishing” (“The fish caught are only a lesser part of the catch”), all in celebration of the everyday events of life in the country. Begin each day with the gentle wit and wisdom of the person who, for nearly four decades, wrote his “outdoor editorials” in an engaging and inimitable fashion eagerly read by thousands.

Most of our interactions with others occur within the framework of recurring social situations, and the language choices we make are intimately tied to situational features. Although the interdependence between language and social situations has been well recognized at least since G. H. Mead developed his symbolic interactionist theory, psychologists have been reluctant to devote much interest to this domain until recently. Yet it is arguable that a detailed understanding of the subtle links between situational features and language use must lie at the heart of any genuinely social psychology. This volume contains original

contributions from psychologists, linguists and philosophers from the United States, Canada, Europe, Israel, and Australia who share an interest in the social-psychological aspects of language. Their work represents one of the first concentrated attempts to chart the possibilities of this exciting field. It is perhaps in order to say a few words about the origins of this book. The need for a volume integrating research on language and social situations first emerged during the 2nd International Conference of Language and Social Psychology at Bristol University in 1983, at which I was convening a symposium with a similar title at the request of the

organizers, Peter Robinson and Howard Giles. When they first approached me with this idea in 1982, I gladly accepted, since my own research on cognitive representations of social episodes seemed eminently relevant to a symposium on language and social situations.

How are we to understand the complex forces that shape human behavior? A variety of diverse perspectives, drawing upon studies of human behavioral ontogeny, as well as humanity's evolutionary heritage, seem to provide the best likelihood of success. It is in the attempt to

synthesize such potentially realities of the care and disparate approaches to human development into an integrated whole that we undertake this series on the Genesis of Behavior. In many respects, the incredible burgeoning of research in child development over the last decade or two seems like a thousand lines of inquiry spreading outward in an incoherent starburst of effort. The need exists to provide, on an ongoing basis, an arena of discourse within which the threads of continuity between those diverse lines of research on human development can be woven into a fabric of meaning and understanding. Scientists, scholars, and those who attempt to translate their efforts into the practical

guidance of infants and children are the audience that we seek to reach. Each requires the opportunity to see-to the degree that our knowledge in given areas permits-various aspects of development in a coherent, integrated fashion. It is hoped that this series, which will bring together research on infant biology, developing infant capacities, animal models, the impact of social, cultural, and familial forces on development, and the distorted products of such forces under certain circumstances, will serve these important social and scientific needs.

Developmental Social Cognitive Neuroscience

In recent years, much stimulating research has emerged on children's theories of mind, construed

as the understanding of others' intentions, beliefs, and desires. In this context, there is a renewed interest in the developmental origins of social cognition. This book is an expression of this new interest, assembling current conceptualizations and research on the precursors of joint engagement, language, and explicit theories of mind. The focus is on what announces such remarkable development. The book is divided into four parts. Part I deals with the nature and development of social cognition in infancy. Each contribution provides a different view of the important features of social cognition in the first months of life. Part II presents recent empirical findings on the developing ability by young infants to detect whether caretakers and social partners are attentive

and responsive to their own behavior in social exchanges. Part III focuses on the early development of infants' ability to monitor others in their action, their gazing, their animacy, and their emotion. Part IV offers a commentary on the contributions as a whole, discussing the basic theoretical assumptions guiding current research on early social cognition. The author identifies the conceptual strengths and weaknesses of the work presented and suggests interesting avenues for future research.

Animals lead rich social lives. They care for one another, compete for resources, and mate.

Within a society, social relationships may be simple or complex and usually vary considerably, both between different groups of individuals and over time.

These social systems are fundamental to biological organization, and animal societies are central to studies of behavioral and evolutionary biology. But how do we study animal societies? How do we take observations of animals fighting, grooming, or forming groups and produce a realistic

description or model of their societies? Analyzing Animal Societies presents a conceptual framework for analyzing social behavior and demonstrates how to put this framework into practice by collecting suitable data on the interactions and associations of individuals so that relationships can be described, and, from these, models can be derived. In addition to presenting the tools, Hal Whitehead illustrates their applicability using a wide range of real data on a variety of animal species—from bats and chimps to dolphins and birds. The techniques that Whitehead describes will be profitably adopted by scientists working with primates, cetaceans, birds, and ungulates, but the tools can be used to study societies of invertebrates, amphibians, and even

humans. Analyzing Animal Societies will become a standard reference for those studying vertebrate social behavior and will give to these studies the kind of quality standard already in use in other areas of the life sciences.

Gun-fighter! Deputy Marshal! Romantic! Friend to the Trinidad priest and Marshal Bat Masterson! Jack "Applejack" Martin is a youthful gun-fighting deputy! After his parent's death, Applejack leaves the family's hardscrabble ranch to travel to Trinidad, Colorado. Along the way, he fights a bandito and is badly beaten. While recovering,

Jack encounters a wounded outlaw and saves the gunman's life. In return, the young man is taught to be a pistolero of extreme skill. Arriving in Trinidad, Applejack prevents Bat Masterson from being killed and is hired by the noted marshal to become one of his deputies. The unworldly young lawman falls in love with a wealthy seniorita and must confront her hateful and arrogant father. The deputy's innocence, but great skill with a revolver, quickly elicits the respect of Trinidad's residents, of Masterson, and of other deputies, and it transforms the ranch boy into a man. Through the intriguing character of Applejack, author Charlie Steel weaves a riveting

and fascinating tale around very real people and events of the old West that include not only the famous marshal but also a wayward and colorful priest.

It took all of thirty seconds for two shots to bring the

world of Margaret Tabaaha crashing down around her. After losing her husband in Afghanistan during the first year of Operation Enduring Freedom, her two sons were all she had left. Now they had been taken from her violently, deliberately, plunging her into a whiskey bottle and stripping away her reason for living. When Arthur Nakai receives a call from his first love, Margaret, her voice pleading for his help, it comes as he is attending a wake for one of the men he considered a brother from his days in the Marines 6th LAR Wolf Pack Battalion. Feeling a deep and responsible obligation to help her, Arthur soon finds himself involved in the multi-billion-dollar world of the oil and gas industry and coming face-to-face with an old adversary, Elias Dayton. Their paths had crossed when Arthur was a member

of the Shadow Wolves, an elite tactical unit within US Customs and Border Protection. Now Dayton runs Patriot Security, a Blackwater-type firm that keeps the oil rigs, gas wells, and man camps secure from the Water Protectors, protesters pushing to stop the fracking and poisoning of Native lands. As Arthur works through the case from his end, Navajo police chief Jake Bilagody tackles it from another angle, looking into the strained relationship between the oil company and the Navajo people, all while searching for a missing Navajo man that may have become an unwilling piece on the reservation checkerboard. But when Arthur learns the identity of the boys' killer, he struggles to make sense of it. Because if the clues are right, he will be forced to make a decision that will

haunt him for the rest of his life.

We live in a world in which inconsistency is the rule rather than the exception and this is particularly true for rewards and frustrations. In some cases, rewards and frustrative non-rewards appear randomly for what seems to be the same behaviour; in others a sequence of rewards is suddenly followed by non-rewards, or large rewards by small rewards. The important common factor in these and other cases is frustration - how we learn about it and how we respond to it. This book provides a basis in learning theory and particularly in frustration theory, for a comprehension not only of the mechanisms controlling these dispositions, but also of their order of appearance in early development and, to an

approximation at least, their neural underpinnings.
