Devon wants to know why his skin looks different from his sister's. But when he asks, he gets more of an answer than he bargained for! With the help of his parents, Devon learns about how genes impact the way we look--and that family is more than skin-deep! About the authors: Devon and Keonna Scott are an Atlanta, Georgia-based family. Devon is a professional basketball player who has played in many countries. Keonna is a stay-at-home mother with three degrees in early childhood education. With Devon's job taking their family all over the globe, Keonna

decided to put her degrees to good use by actively homeschooling her two children, Devon Jr. and Aria. Devon and Keonna pride themselves on raising a faith-based family and credits their deep roots in The Lord as their means for their success in life. It is their hope that their actions will reach people, leaving behind a legacy of positivity, love, and faith.

Fundamentals of the Physical-Chemistry of Pulverized Coal Combustion Springer Science & Business Media

The study of coal for the production of energy is certainly not a new area of research. Many research works were carried out to improve the efficiency of industrial and domestic facilities. In the sixties, however, because of the availability and low cost of petroleum, coal consumption decreased and the research effort in this area was minimum. Meanwhile, the situation has totally changed. Considering the reserves of oil and the instability of regions where they are located, it is becoming absolutely necessary to develop other sources of energy. The major alternative to oil appears to be

coal, at least for the near future. Indeed, the reserves known today represent several centuries of energy consumption. It is therefore becoming urgent to develop efficient and non polluting technologies to produce energy from coal. The main possibilities are : • liquefaction • gasification • directed combustion. Research and development efforts on liquefaction have been considerably reduced because of high cost of technologies involved and poor prospects for the next two decades. Research works on gasification are progressing; it is a promising approach. However, direct combustion either in pulverized coal furnaces or in fluidized beds is the more promising way of expanding rapidly the utilization of coal. These techniques are already used in some facilities but many environmental problems remain, slowing down their development. *Multifunctional Mesoporous Inorganic Solids* Rockridge Press

One Drop at a Time

1. Introduction. There is much interest in the general

subject of porous inorganic materials with respect to their use as sorbents or catalysts. Such inorganic solids may be microporous, mesoporous or macroporous according to the sizes of the pores within the solid. Often there is a range of pore sizes within any given solid and so there is special interest in the synthesis, characterisation and application of porous inorganic solids with well defined pores. Pores of diameter larger than 50 nm are generally termed macropores. Those with diameters of less than 2 nm are micropores and pores of intermediate size are called mesopores. Solids, which contain only mesopores, are correctly called mesoporous but very often there is a combination of different types of porosities within

one given solid. The synthesis, characterisation and application of microporous solids is much more advanced than is the case with mesoporous substances. Moreover, the synthesis of crystalline mesoporous materials is one clear goal for the future but which has not been attained so far. Consequently, it is of interest to examine the current state of our knowledge of microporous materials and to examine how this may apply to mesoporous materials. Both catalytic and sorption processes could benefit from studies of mesoporous solids because the mesopores could permit diffusion of larger reactants or products than is the case in microporous materials. 2. *My Favorite Bible Verse Devotional Hard Cover*
