The design philosophies of Google and Apple represent different approaches to new product design.

Google's model features bottom-up and data-driven decision-making processes, while Apple's model is to design and build products top-down. Library instruction program design may learn from these differing but complementary approaches. Inspired by Google's and Apple's success, Library Instruction Design details how library instruction program design may learn from the philosophy of product design in the business world. In designing library instruction, a Google-philosophy approach teaches what the user wants to know while an Apple-philosophy approach teaches what the librarian thinks the user needs to learn. These two design philosophies aim at different

teaching objectives reflecting library and information science education in modern society. The book is divided into five sections, with opening sections covering library instruction, the philosophy of library instruction design and design philosophy from different angles. Later sections discuss applying Google's model and applying Apple's model. Offers a creative way to think about library instruction program design Suggests two design approaches grounded in two philosophies, represented by the design approaches of Google and Apple Details the differences and complementarities between top-down and bottom-up approaches to design

This book is intended to introduce and familiarize design, production, quality, and process engineers, and their managers to the importance and recent developments in concurrent engineering (CE) and design for manufacturing (DFM) of new products. CE and DFM are becoming an important element of global competitiveness in terms of achieving high-quality and low-cost products. The new product

design and development life cycle has become the focus of many manufacturing companies as a road map to shortening new product introduction cycles, and to achieving a quick ramp-up of production volumes. Customer expectations have increased in demanding high-quality, functional, and user-friendly products. There is little time to waste in solving manufacturing problems or in redesigning products for ease of manufacture, since product life cycles have become very short because of technological breakthroughs or competitive pressures. Another important reason for the increased attention to DFM is that global products have developed into very opposing roles:

either they are commodities, with very similar features, capabilities, and specifications; or they are very focused on a market niche. In the first case, the manufacturers are competing on cost and quality, and in the second they are in race for time to market. DFM could be a very important competitive weapon in either case, for lowering cost and increasing quality; and for increasing production ramp-up to mature volumes.

Redesigns are part of every designer's repertoire, but sometimes getting inspired or motivated to redesign an existing logo can be challenging and cumbersome. The goal of maintaining equity by using existing elements in new ways and combining them with new elements is akin to the task of "recycling." In other words - how do designers improve and recreate identities without throwing out the usable stuff that makes up the existing brand? Recycling and Redesigning Logos demonstrates the strategies and processes of successful redesigns and shows readers how to build on the equity the brand already retains to create a fresh look. The case studies feature before and afters of the

logos and discuss why the redesign was necessary and demonstrate how to reuse, reformat and build on the ingredients, materials and essence that is already there.
