This book demonstrates the challenges and opportunities of climate change actions in developing countries and primarily focuses on case studies in Indonesia, the world ’ s fourth most populous country. The most important feature of the book is its examination of multiple facets of climate change issues in Indonesia, which allows readers to understand the complexity of climate change in developing countries: the synergies and trade-offs between different climate change actions as well as between climate and development priorities. Another unique feature is that it was jointly written by Indonesian and international authors, as well as by academics and development practitioners. This book addresses questions concerning mitigation measures in major sectors with original analyses of aspects including energy subsidies, sectoral energy efficiencies in manufacturing sectors, forest concessions, energy-saving labeling schemes, policy mixes for the urban transportation sector, and the introduction of waste-to-energy technologies. The book provides first-hand knowledge and data on energy and the institutional realities in Indonesia, which are not widely and readily available to an international audience. It offers a valuable reference guide for professionals working for governments and NGOs and donor agencies in the fields of climate change and development in developing countries. This work is also a valuable resource for undergraduate and graduate students of economics and environmental and development studies, in particular those who are interested in the synergies and conflicts between climate change and development.

“ [A] history of air conditioning, chronicling the numerous gimmicks, failed attempts, con jobs, and eventual successes . . . a surprisingly interesting journey. ” —San Francisco Book Review The air conditioner is often hailed as one of the modern world ’ s greatest inventions—yet nearly as often blamed for global disaster. It has changed everything from architecture to people ’ s food habits; saved countless lives, and caused countless deaths. First appearing in 1902, when Willis Carrier, an engineer barely out of college, developed the “ Apparatus for Treating Air, ” everyone assumed it would instantly change the world. But the story of air conditioning and its rise to ubiquity is far from simple. In Cool, Salvatore Basile tracks two fascinating stories: the struggle to perfect an effective cooling device, and the effort to convince people that they actually needed such a thing. With a cast of characters ranging from Leonardo da Vinci to Richard Nixon and Felix the Cat, Cool showcases the myriad reactions to air conditioning as it was developed and introduced to the world. Here is a unique perspective on a common convenience: how we came to rely on it today, and how it might change radically tomorrow.
