Adventure and extreme sports are increasing in popularity and it is not surprising that commercial adventure tourism and the accompanying life style and fashion, have become increasingly important to world economy. These unique sports involve not only major physical endurance and mental challenges but interaction and bonding with nature. They also tend to attract and excite audiences,

both at the event and in the media. They are exciting to watch and redraw the boundaries of human achievement with the accompanying risks of injury and death. Adventure sports are usually performed in beautiful, exciting and remote locations or in extreme environments far away from medical assistance. Extreme sports usually involve an element of increased risk. These risks are highlighted by the media, usually after a reported accident or fatality but may vary according to the involvement of the participant; the weekend recreational adventure sports athlete or the experienced professional. A wide variety of sports fall into the category of adventure and extreme sports and with an increasing number of disciplines, this field is ever expanding. Sports are performed in contact with the “ground”; mountain running and biking, rock climbing, ice climbing and mountaineering. In the air: skydiving and base jumping. On water: surfing, white water kayaking and rafting, board sailing and diving. And also involve mechanical vehicles and animals! Some sports may be performed as a combination of few disciplines, such as water and air, e.g. kite surfing, and as so involve very unique mechanisms of injury. Sports events can also be merged to form a multi-sport race comprising many disciplines lastly from single to multi day races. Sports may involve competition with others, against the environment or with oneself, frequently the most ferocious adversary. Adventure sports are becoming increasingly popular in the general public and a few take these sports to an extreme level with the accompanying risks. Those that do, bring such time and dedication that they become professional in terms of training, preparation and finance.

More and more people are enjoying adventure sports and unfortunately increased numbers are becoming injured as a result. Future research is progressing alongside the sport development, to allow the sport mechanisms, injury patterns and predisposing factors to be better understood. It is the hope of all researchers to make the sports safer without detracting from their adventurous nature. The aim and scope of our book would be to bring the sports medicine involved in each of these sports into one volume. We would explain each sport including subtle similarities and differences, the common injury mechanisms, patterns of injury and treatment options. Additional chapters would include the mental characteristics of adventure racers and extreme sports athletes, together with the complexities of competing in hot and cold extreme environments. The book will present chapters focussing on the sports listed below, concentrating on published literature and newly formed studies by experts in the fields of injury epidemiology, prevention, management and rehabilitation.

From a gymnast hiding ankle pain so she can compete to a basketball player who withdraws from friends after a season-ending injury, it can be argued that every sport injury affects or is affected in some way by psychological factors. Given the widespread importance of psychological issues in sport injury, it is important for those working with athletes—injured or not—to be aware of the latest developments on the subject. Written by a sport psychology consultant and an athletic trainer, *Psychology of Sport Injury* provides a thorough explanation of the elements and effects of sport injuries along with up-to-date research and insights for practical application. The authors offer a contemporary approach to preventing, treating, rehabilitating, and communicating professionally about sport injuries that takes into account physical,

psychological, and social factors. Psychology of Sport Injury presents sport injury within a broader context of public health and offers insights into the many areas in which psychology may affect athletes, such as risk culture, the many facets of pain, athlete adherence to rehab regimens, the relationship between psychological factors and clinical outcomes, collaboration, and referrals for additional support. The book explores the relevant biological, psychological, and social factors that affect given circumstances. The text consists of four parts: Understanding and Preventing Sport Injuries, Consequences of Sport Injury, Rehabilitation of Sport Injury, and Communication in Sport Injury Management. Psychology of Sport Injury includes evidence-based examples and demonstrates real-world applications that sport health care professionals often face with athletes. Additional pedagogical features include the following:

- Focus on Research boxes provide the what and why of the latest research to complement the applied approach of the text.
- Focus on Application boxes highlight practical examples to illustrate the material and maintain student engagement.
- Psychosocial content aligned with the latest educational competencies of the National Athletic Trainers' Association (NATA) helps students prepare for athletic training examinations and supports professional development for practitioners.
- A prevention-to-rehabilitation approach gives a framework for understanding sport injury, including precursors to injury, pain as a complex phenomenon, adherence to rehabilitation, and communication and management of injuries with other health care professionals as well as the athlete.
- A set of chapter quizzes and a presentation package aid instructors in testing student comprehension and preparing lectures.

Psychology of Sport Injury is an educational tool, reference text, and springboard to new ideas for research and practice in any line of work exposed to sport injury. Observing and committing to athletes, especially during times of physical trauma and emotional distress (which are often not separate times), are critical skills for athletic trainers, physical therapists, sport psychologists, coaches, and others who work with athletes on a regular basis.

The book is composed of seven parts. In the beginning part, current situations and the general characteristics of sports-related injuries are outlined on the basis of an investigation utilizing statistical data involving a large number of populations. In the following parts, detailed information on the injuries in terms of the types of sports activities, body sites, symptoms and the

relationships among these factors are discussed. Part 2, for example, deals with topics on concussion and severe head–neck injuries which occur frequently in rugby and judo. In Parts 3 and 4, as one of the major sports-related injuries, anterior cruciate ligament (ACL) injuries are discussed. Beginning with the underlying mechanisms as assessed by using the latest measuring techniques, characteristic features of their occurrence are described. Further, Part 4 deals with topics on post-operative (ACL reconstruction) aspects of ACL injuries, especially those related to muscle functions and tendon regeneration in the hamstring muscles. Part 5 deals with muscle strain and focuses particularly on those occurring in the hamstring muscles, as this muscle group is known, as one of the most frequent sites of muscle strain. Much is known about the physical strain that athletes' bodies are subjected to and the dangerous aspects of competition immediately spring to mind. But why do athletes train the way they do, and why do they push the limits? Why do some recover well from injury while others struggle? Despite decades of medical and sport

science research, a piece has been missing from this picture. Until recently, the role of psychological factors in risk and rehabilitation has been poorly understood. Thankfully, there is increasing awareness of just how crucial these factors can be for predicting injury, improving recovery, developing prevention strategies, and supporting athletes' long-term health. Yet, research in this area is still in its infancy and it can be difficult to synthesize an ever-growing body of knowledge into practical injury management approaches. Using analogies from everyday life, *The Mental Impact of Sports Injury* bridges the gap between academic research and practical settings in an informative, yet easy to follow guide to the psychology of sports injury. Addressing risk, rehabilitation, and prevention, it outlines key considerations for researchers and practitioners across all levels of sport. Alongside the fundamentals of injury psychology, emerging areas of importance are also discussed, including training load monitoring and the technological advances that are shaping modern sport medicine. Targeted examples highlight the challenges of preventing and managing injury in grassroots, elite, and professional contexts, with chapters dedicated to the under-served communities of youth and Para sport athletes. Stepping away from traditional texts, this unique book presents the landmark literature, major concepts, and athlete insights into sports injury psychology from a totally new perspective.

With the rise in active participation in sports and exercise by older people, Injury Prevention and Rehabilitation for Active Older Adults is both timely and instructive. It explores the issues involved in working with active older adults, providing a valuable resource to help sports medicine professionals prevent, diagnose, and treat injuries for this growing population. Geared toward those working with active seniors--from competitive and recreational athletes to fitness enthusiasts--Injury Prevention and Rehabilitation for Active Older Adults contains the information to help practitioners -strengthen their understanding of general issues in sports medicine for active seniors; -explore prevention of, and determine treatment for, specific injuries; -apply to their own practice the knowledge of specialists experienced in working with older populations; and -implement and supervise appropriate conservative therapies. Injury Prevention and Rehabilitation for Active Older Adults was written by a team of specialists with extensive experience in treating active seniors. While it emphasizes conservative treatment over surgery, it also guides readers in knowing when to refer a client to a surgeon, how to prepare a client for what might happen when referred, and what type of surgery might be indicated. Therapists and trainers will strengthen their ability to explain their basis for both treatment and referral. Part I focuses on a variety of issues in sports medicine for active seniors, including senescent changes in the musculoskeletal system, exercise testing and prescription, and factoring the kinetic chain into prevention and therapy. Flexibility, stretching, and massage for older people are also covered, as are nutrition, nutritional supplements, and pharmacology. Part II, organized by anatomical areas, delves into specific

injuries and conditions in active seniors.

This approach helps readers easily locate regional musculoskeletal problems and identify appropriate rehabilitation procedures. These regions include the shoulder, elbow, hand and wrist, spine, hip, knee, and foot and ankle. Common injuries, conditions, and treatments are explored in each area. Accompanying photos and illustrations supplement the text, showing stretches for all parts of the body, exercises for both injury prevention and rehabilitation, diagnostic techniques (including special tests and best X-ray positions) and various treatment options. The result is a reference that facilitates understanding of the issues involved in preventing and treating injuries in active older people and in helping them recover and return to full activity as soon as possible.
