The inside story of the laptop that exposed the president's dirtiest secret.
When a drug-addled Hunter Biden abandoned his waterlogged computer at a

Mac repair shop in Delaware in the spring of 2019, just six days before his father announced his candidacy for the United States presidency, it became the ticking time bomb in the shadows of Joe Biden's campaign. The dirty secrets contained in Hunter's laptop almost derailed his father's presidential campaign and ignited one of the greatest media coverups in American history. This is the unvarnished story of what's really inside the laptop and what China knows about the Bidens, by the New York Post journalist who brought it into the open. It exposes the coordinated censorship operation by Big Tech, the media establishment, and former intelligence operatives to stifle the New York Post's coverage, in a chilling exercise of raw political power three weeks before the 2020 election. A treasure trove of corporate documents, emails, text messages, photographs, and voice recordings, spanning a decade, the laptop provided the first evidence that President Joe Biden was involved in his son's ventures in China, Ukraine, and beyond, despite his repeated denials. This intimate insight into Hunter's dissolute lifestyle shows he was incapable of holding down a job, let alone being paid tens of millions of dollars in high-powered international business deals by foreign interests, unless he had something else of value to sell—which of course he did. He was the son of the vice president who would go on to become the leader of the

free world.

Book of Vaadin Simon and Schuster

The Spring framework is growing. It has always been about choice. Java EE focused on a few technologies, largely to the detriment of alternative, better solutions. When the Spring framework debuted, few would have agreed that Java EE represented the best-in-breed architectures of the day. Spring debuted to great fanfare, because it sought to simplify Java EE. Each release since marks the introduction of new features designed to both simplify and enable solutions. With version 2.0 and later, the Spring framework started targeting multiple platforms. The framework provided services on top of existing platforms, as always, but was decoupled from the underlying platform wherever possible. Java EE is a still a major reference point, but it 's not the only target. OSGi (a promising technology for modular architectures) has been a big part of the SpringSource strategy here. Additionally, the Spring framework runs on Google App Engine. With the introduction of annotation-centric frameworks and XML schemas, SpringSource has built frameworks that effectively model the domain of a specific problem, in effect creating domain-specific languages (DSLs). Frameworks built on top of the Spring framework have emerged supporting application integration, batch processing, Flex and Flash integration, GWT, OSGi, and much more.

The Manual of Tests and Criteria contains criteria, test methods and procedures to be used for classification of dangerous goods according to the provisions of Parts 2 and 3 of the United Nations Recommendations on the Transport of Dangerous Goods, Model Regulations, as well as of chemicals presenting physical hazards according to the Globally Harmonized System of Classification and Labelling of Chemicals (GHS). As a consequence, it supplements also national or international regulations which are derived from the United Nations Recommendations on the Transport of Dangerous Goods or the GHS. At its ninth session (7 December 2018), the Committee adopted a set of amendments to the sixth revised edition of the Manual as amended by Amendment 1. This seventh revised edition takes account of these amendments. In addition, noting that the work to facilitate the use of the Manual in the context of the GHS had been completed, the Committee considered that the reference to the "Recommendations on the Transport of Dangerous Goods" in the title of the Manual was no longer appropriate, and decided that from now on, the Manual should be entitled "Manual of Tests and Criteria".

Point counts of birds are the most widely used quantitative method and involve an observer recording birds from a single point for a standardized time period. In response to the need for standardization of methods to monitor bird populations by census, researchers met to present data from various investigations working under a wide variety of conditions, and to examine various aspects of point count methodology. Statistical aspects of sampling and analysis were discussed and applied to the objectives of point counts. The final chapter presents these standards and their applications to point count methodology.
