How to Critique Journal Articles in the Social Sciences, by Scott R. Harris, is a brief, introductory book that provides readers with a step-by-step guide to reading and understanding a social science research article. The author demonstrates the many strengths of social research, including its advantages over ordinary ways of knowing things, and, at the same time, points out that research is inevitably flawed. Rather than naively assuming that good research simply produces "The Truth" or cynically asserting that research is hopelessly biased and futile, this book instills in readers a critical perspective—one that appreciates the strengths and weaknesses of any piece of scholarship.

The United States government spends billions of dollars on home ownership programs in low and moderate income communities. However, there is paucity of academic research to assess the socioeconomic impacts of these programs. The purpose of this empirical research was to assess their possible impacts. The key research question explored the relationship between low and moderate income home ownership, the independent variable, and the dependent variables of the rates of crime, unemployment, high school graduation, and standardized test scores in the communities concerned. The research design was quantitative-causal. Welfare economic theory formed the theoretical foundation for the study. Using public records, data were collected from four low and moderate income communities in major Midwestern

metropolitan areas. The proposed relationships were tested through independent sample t-tests and regression analyses. Results indicated no significant relationship between low and moderate home ownership rate and the rates of the studied socioeconomic indicators. A significant social change implication of this finding would be to relocate federal dollars from housing schemes to more socially and economically relevant programs, such as those geared toward improving educational opportunities in low and moderate income communities.

Qualitative Research in Education: A User's Guide SAGE

This study involved an exploration of the impact of organizational capital investment on employee innovation in the manufacturing industry. The overarching question was: Does organizational capital investment impact employee innovation in the manufacturing industry? Organizations tend to place much emphasis on how skill drives innovation, but not on how capital investment impact employee innovation. The research was guided using a qualitative phenomenological case study design to probe the impact of capital investment on employee innovation. Participants were selected through a convenience and purposive sampling method using the researchers personal professional network as well as the snowball method to seek participants from individuals referrals. Data collection involved personal interviews, audio recording, and note taking. The assumption was that employee innovation is not an option but a necessity, because organizations compete on global fronts for resources and market share. Consequently, capital investment in machinery and employee innovation becomes symbiotic in nature, not mutually exclusive. Results showed employee innovation can be impacted and enhanced through the acquisition and application of appropriate technological capital investment. The researcher recommends further research to ascertain whether the amount of organizational capital investment is proportional to the development of employee innovativeness.
