Sterilizing Solution

Sterilization refers to any process that removes, kills, or deactivates all forms of life (in particular referring to microorganisms such as fungi, bacteria, viruses, spores, unicellular eukaryotic organisms such as

Plasmodium, etc.) and other biological agents like prions present in a specific surface, object or fluid, for example food or biological culture media.

Mix 1 teaspoon of unscented bleach in 16 cups of hot water. Immerse the feeding equipment in the solution in such a way that there isn't any air bubble formation at the bottom of the bottle. Soak the bottle for 2 – 5 minutes, and then pull them out of the solution using sterilized tongs.

Ideally, items entering a patient's mouth or coming into contact with oral tissues should be heat sterilized; however, when this is not option because the device or instrument cannot withstand the heat sterilization process, a high-level cold sterilization solution should be used. Instruments sterilized in this manner should be rinsed with sterile water, dried and placed in a sterile container (if not used immediately).
