Designing Better Architecture Education is an outcome of a research conducted systematically with diligence, passion, wide and in-depth exercise on the obvious and latent aspects of undergraduate architecture education. Although specific to India, this study probes the diverse global scenario in acknowledgement of the global style of architecture, where green preferences surface as compulsion. The findings are arranged systematically, analyzed impartially and inferred upon logically. The final bunch of suggestions aimed at a much

desirable architecture education revamp in India is, in fact, relevant for architecture education as a whole anywhere. The author suggests compaction of graduation time, intensification of exposures, interactions and instructions, shift of focus, introduction of contemporary specializations, restructuring intake, revamping academic administration and a significant change of stance in teaching itself, including methods, philosophy, attitude and paraphernalia. The book provides valuable information, insight and suggestions to rejuvenate the academic approach to the education of architecture and forms a reliable basis for further endeavour in this direction.

The book presents interesting examples of recent developments in this area. Among the studied materials are bulk metallic glasses, metamaterials, special composites, piezoelectric smart structures, nonwovens, etc. The last decades have seen a large extension of types of materials employed in various applications. In many cases these materials demonstrate mechanical properties and performance that vary significantly from those of their traditional counterparts. Such uniqueness is sought – or even specially manufactured – to meet increased requirements on modern components and structures related to their specific use. As a result, mechanical behaviors of these materials under different loading and environmental conditions are outside the boundaries of traditional mechanics of materials, presupposing development of new characterization techniques, theoretical descriptions and numerical tools. The book presents interesting examples of recent developments in this area. Among the studied materials are bulk metallic glasses, metamaterials, special composites, piezoelectric smart structures, nonwovens, etc.

Mechanical Behavior of Materials CRC Press

This book is the outcome of one of the Forum Series on Architectural Education, organized by the Architectural Education Association of Turkey (MIMED) on the theme of “ Flexibility in Architecture. ” At Forum IV, the architectural education platform was cross-examined, new ideas and experiences were shared, and the potentials of “ regeneration ” were discovered. The notion of flexibility in architectural education is the subject of fresh and vital debate which is based on

whether it is achieved by the inner dynamics of architecture, or the external dynamics. However, this debate seems null and void since the dynamics of both sides seem to necessitate flexibility in architectural education at almost the same level. Hence the attitude that the prerequisite for creating flexibility according to the inner dynamics of architecture depends on the protection of architectural education from the coercive effects of external dynamics is no longer a relevant issue. Furthermore, architectural education as a role model in such a debate becomes more important, not only in a monotyping global context, but also in the local social context as well. Herein lies a fundamental dichotomy arising from the fact that because of globalization curricula may face the risk of becoming uniform. Any effort to overcome this dichotomy in such a debate seems vital. Then, the question arises whether such a dichotomy, which turns architectural education from an autonomous discipline into a quasi-autonomous one, transforms architectural education into a rather political issue. If the autonomous nature of architectural education resists globalization, the question of the manner in which this resistance occurs and what impact it will have on architectural education seems of the utmost importance. The volume begins with a preface by Gulsun Saglamer, President of MIMED. Contributors include Juhani Pallasmaa, Kim Dovey, Kojin Karatani, Herman Neuckermans, Conall Ó Catháin, Mark Olweny, Ugur Tanyeli, Ferhan Yurekli, Gulsun Saglamer, Fatma Erkok, Rengin Unver, Cigdem Polatoglu, S. Strength of Materials and Structures Springer

A balanced mechanics-materials approach and coverage of the latest developments in biomaterials and electronic materials, the new edition of this popular text is the most thorough and modern book available for upper-level undergraduate courses on the mechanical behavior of materials. To ensure that the student gains a thorough understanding the authors present the fundamental mechanisms that operate at micro- and nano-meter level across a wide-range of materials, in a way that is mathematically simple and requires no extensive knowledge of materials. This integrated approach provides a conceptual presentation that shows how the microstructure of a material controls its mechanical behavior, and this is reinforced through extensive use of micrographs and illustrations. New worked examples and exercises help the student test their understanding. Further resources for this title, including lecture slides of select illustrations and solutions for exercises, are available online at www.cambridge.org/97800521866758.
