For courses in introductory combined Statics and Mechanics of Materials courses found in ME, CE, AE, and Engineering Mechanics departments. Statics and Mechanics of Materials represents a combined abridged version of two of the author ' s books, namely Engineering Mechanics: Statics, Fourteenth Edition and Mechanics of Materials, Tenth Edition. It provides a clear and thorough presentation of both the theory and application of the important fundamental topics of these subjects that are often used in many engineering disciplines. The development emphasizes the importance of satisfying equilibrium, compatibility of deformation, and material behavior requirements. The hallmark of the book remains the same as the author ' s unabridged versions with a strong emphasis on drawing a free-body diagram and on the importance of selecting an appropriate coordinate system and an associated sign convention whenever the equations of mechanics are applied. Throughout the book, many analysis and design applications are presented, which involve mechanical elements and structural members often encountered in engineering practice. Mechanics of Materials Pearson Prentice Hall

The fourth edition of Applied Statics and Strength of Materials presents an elementary, analytical, and practical approach to the principles and physical concepts of statics and strength of materials. It is written at an appropriate mathematics level for engineering technology students, using algebra, trigonometry, and analytic geometry. A knowledge of calculus is not required for understanding the text or for working the problems. The book is intended primarily for use in two-year or four-year technology programs in engineering, construction, or architecture. Much of the material has been classroom tested in our Accreditation Board for Engineering

and Technology (ABET) accredited engineering technology programs as well as in our American Council for Construction Education (ACCE) accredited construction technology program. The text can also serve as a concise reference guide for undergraduates in a first Engineering Mechanics (Statics) and/or Strength of Materials course in engineering programs. Although written primarily for the technology student, it could also serve as a valuable guide for practicing technologists and technicians as well as for those preparing for state licensing exams for professional registration in engineering, architecture, or construction. The emphasis of the book is on the mastery of basic principles, since it is this mastery that leads to successful solutions of real-life problems. This emphasis is achieved through abundant worked-out examples, a logical and methodical presentation, and a topical selection geared to student needs. The problem-solving method that we emphasize is a consistent, comprehensive, step-by-step approach. The principles and applications (both examples and problems) presented are applicable to many fields of engineering technology, among them civil, mechanical, construction, architectural, industrial, and manufacturing. This fourth edition was prepared with the objective of updating the content where necessary and rearranging and revising some of the material to enhance the teaching aspects of the text. While the primary unit system remains the U.S. Customary System, metric (SI) units continue to be used throughout the text, and the examples and problems reflect a mix of the two measurement systems. The homework problem sets have some additions and some deletions, and some other problems were revised. The book includes the following features: Each chapter is written to introduce more complex material gradually. Problems are furnished at the end of each chapter and are grouped and referenced to a specific section. These are then followed by a group of supplemental problems provided for review purposes. Generally, problems are arranged in order of increasing difficulty. A summary at the end of each chapter presents a thumbnail sketch of the important concepts presented in the chapter. Useful tables of properties of areas and conversion factors for U.S. Customary-SI conversion are printed inside the covers for easy access. Most chapters contain computer problems following the section problems. These problems require students to develop computer programs to solve problems pertinent to the topics of the chapter. Any appropriate computer software may be used. The computer problems are another tool with which to reinforce students' understanding of the concepts under consideration. Answers to selected problems are provided at the back of the text. The primary unit system in this book remains the U.S. Customary system. SI, however, is fully integrated in both the text and the problems. This is a time of transition between unit systems. Much of the new construction work in the public sector (particularly in the transportation field) now uses metric (SI) measurement; full conversion to SI in the technology field in the United States is inevitable and will undoubtedly occur eventually. Technicians and technologists must be familiar with both systems. To make the book self contained, design and analysis aids are furnished in an extensive appendix section. Both U.S. Customary and SI data are presented. Calculus-based proofs are introduced in the appendices. The Instructor's Manual includes complete solutions for all the end-of-chapter problems in the text. There is sufficient material in this book for two semesters of work in statics and strength of materials. In addition, by selecting certain chapters, topics, and problems, the instructor can adapt the book to other situations, such as separate courses in statics (or mechanics) and strength of materials. Thanks are extended to many colleagues, associates, and students who with their enthusiastic encouragement, insightful comments, and constructive criticisms have helped with the input for this edition. A special word of thanks goes to James F. Limbrunner, P.E., for his contributions to the text and help with proofreading and problem sets. Also, appreciation is extended to the reviewers for this edition for their help and

constructive suggestions: Elliot Colchamiro, New York City Technical College, and Dorey Diab, Stark State College. And last, my thanks to Jane Limbrunner for her support, patience, and understanding during the term of this project. George F. Limbrunner
