In the aftermath of the 2010 Citizens United decision, it's become commonplace to note the growing political dominance of a small segment of the economic elite. But what exactly are those members of the elite doing with their newfound influence? The One Percent Solution provides an answer to this question for the first time. Gordon Lafer's book is a comprehensive account of legislation promoted by the nation's biggest corporate lobbies across all fifty state legislatures and encompassing a wide range of labor and economic policies. In an era of growing economic insecurity, it turns out that one of the main reasons life is becoming harder for American workers is a relentless—and concerted—offensive by the country's best-funded and most powerful political forces: corporate lobbies empowered by the Supreme Court to influence legislative outcomes with an endless supply of cash. These actors have successfully championed hundreds of new laws that lower wages, eliminate paid sick leave, undo the right to sue over job discrimination, and cut essential public services. Lafer shows how corporate strategies have been shaped by twenty-first-century conditions—including globalization, economic decline, and the populism reflected in both the Trump and Sanders campaigns of 2016. Perhaps most important, Lafer shows that the corporate legislative agenda has come to endanger the scope of democracy itself. For anyone who wants to know what to expect from corporate-backed Republican leadership in Washington, D.C., there is no better guide than this record of what the same set of actors has been doing in the state legislatures under its control.

Watch a video introduction here. *Statistics Through Applications* (STA) is the only text written specifically for high school statistics course. Designed to be read, the book takes a data analysis approach that emphasizes conceptual understanding over computation, while recognizing that some computation is necessary. The focus is on the statistical thinking behind data gathering and interpretation. The high school statistics course is often the first applied math course students take. STA engages students in learning how statisticians contribute to our understanding of the world and helps students to become more discerning consumers of the statistics they encounter in ads, economic reports, political campaigns, and elsewhere. New and improved! STA 2e features expanded coverage of probability, a reorganized presentation of data analysis, a new color design and much more. Please see the posted sample chapter or request a copy today to see for yourself.

Drug overdose, driven largely by overdose related to the use of opioids, is now the leading cause of unintentional injury death in the United States. The ongoing opioid crisis lies at the intersection of two public health challenges: reducing the burden of suffering from pain and containing the rising toll of the harms that can arise from the use of opioid medications. Chronic pain and opioid use disorder both represent complex human conditions affecting millions of Americans and causing untold disability and loss of function. In the context of the growing opioid problem, the U.S. Food and Drug Administration (FDA) launched an Opioids Action Plan in early 2016. As part of this plan, the FDA asked the National Academies of Sciences, Engineering, and Medicine to convene a committee to update the state of the science on pain research, care, and education and to identify actions the FDA and others can take to respond to the opioid epidemic, with a particular focus on informing FDA's development of a formal method for incorporating individual and societal considerations into its risk-benefit framework for opioid approval and monitoring.

Inverse problems are concerned with determining causes for observed or desired effects. Problems of this type appear in many application fields both in science and in engineering. The mathematical modelling of inverse problems usually leads to ill-posed problems, i.e., problems where solutions need not exist, need not be unique or may depend discontinuously on the data. For this reason, numerical methods for solving inverse problems are especially difficult, special methods have to be developed which are known under the term "regularization methods". This volume contains twelve survey papers about solution methods for inverse and ill-posed problems and about their application to specific types of inverse problems, e.g., in scattering theory, in tomography and medical applications, in geophysics and in image processing. The papers have been written by leading experts in the field and provide an up-to-date account of solution methods for inverse problems.

Introductory Statistics is designed for the one-semester, introduction to statistics course and is geared toward students majoring in fields other than math or engineering. This text assumes students have been exposed to intermediate algebra, and it focuses on the applications of statistical knowledge rather than the theory behind it. The foundation of this textbook is Collaborative Statistics, by Barbara Illowsky and Susan Dean. Additional topics, examples, and ample opportunities for practice have been added to each chapter. The development choices for this textbook were made with the guidance of many faculty members who are deeply involved in teaching this course. These choices led to innovations in art, terminology, and practical applications, all with a goal of increasing relevance and accessibility for students. We strove to make the discipline meaningful, so that students can draw from it a working knowledge that will enrich their future studies and help them make sense of the world around them.
