Papers With Code : Video Super-Resolution  
Abstract: Recent advances in video super-resolution have shown that convolutional neural networks combined with motion compensation are able to merge information from multiple low-resolution (LR) frames to generate high-quality images. Current state-of-the-art methods process a batch of LR frames to generate a single high-resolution (HR) frame and run this scheme in a sliding window fashion over the entire video, effectively treating the problem as a large number of separate multi-frame ...

Spatial Super Resolution (SR) aims to recover fine image details, smaller than a pixel size. Temporal SR aims to recover rapid dynamic events that occur faster than the video frame-rate, and are therefore invisible or seen incorrectly in the video sequence.

### Fast Direct Super-Resolution by Simple Functions

Video super resolution diagram. The original high-res video sequence is generated by warping the source frame (enclosed by a red rectangle) both forward and backward with some motion fields. The high-res sequence is then smoothed with a blur kernel, down-  
*Super-Resolution from Compressed Video / Semantic Scholar*

Super Resolution is a method to upscale video and images, i.e. increase resolution of a video or picture (terms "upscale", "up-convert" and "uprez" are also widely used). To upscale each frame, information from this very frame and from a number of neighbor frames is effectively used.

### A Bayesian Approach to Adaptive Video Super Resolution

Abstract: Previous CNN-based video super-resolution approaches need to align multiple frames to the reference. In this paper, we show that proper frame alignment and motion compensation is crucial for achieving high quality results. We accordingly propose a 'sub-pixel motion compensation' (SPMC) layer in a CNN framework.

The problem of recovering a high-resolution frame from a sequence of low-resolution and compressed images is considered. The presence of the compression system complicates the recovery problem, as the operation reduces the amount of frequency aliasing in the low-resolution frames and introduces a non-linear
