Written by Olivier Bruel, Professor Emeritus HEC Paris, and a team of contributing experts from academia, consulting and industry, the book is organised into four parts: strategic decisions; operational management of procurement and related supply chain; management of human resources and dedicated information systems; management of performance and change. Transportation: A Global Supply Chain Perspective Kogan Page Publishers

When work began on the first volume of this text in 1992, the science of distribution management was still very much a backwater of general management and academic thought. While most of the body of knowledge associated with calculating EOQs, fair-shares inventory deployment, productivity curves, and other operations management techniques had long been solidly established, new thinking about distribution management had taken a definite backseat to the then dominant interest in Lean thinking, quality management, and business process reengineering and their impact on manufacturing and service organizations. For the most part, discussion relating to the distribution function centered on a fairly recent concept called Logistics Management. But, despite talk of how logistics could be used to integrate internal and external business functions and even be considered a source of competitive advantage on its own, most of the focus remained on how companies could utilize operations management techniques to optimize the traditional day-to-day shipping and receiving functions in order to achieve cost containment and customer fulfillment objectives. In the end, distribution management was, for the most part, still considered a dreary science, concerned with transportation rates and cost trade-offs, expediting and the tedious calculus. Today, the science of distribution has become perhaps one of the most important and exciting disciplines in the management of business.

Handbook of Global Supply Chain Management Wiley Global Education
Integrative planning in supply chains is an essential field in logistics management. But still there are open questions especially in a long-term perspective: In order to align strategic decisions of several supply chain partners an integrated long-term demand planning process is necessary but in many industries still mission. This would enable companies for example to co-ordinate their long-term investments in production facilities as well as transport and storage capacities and therefore increase overall efficiency in supply chains. This edition gives a very good outline about the basic problem, providing further an innovative stepwise approach to solve the integrated planning problem. The concept is matched with the business case 'BP' as a typical company and industry with influential long-term changes ahead. By this business example implementation the real life value of such planning instruments can be shown. This will motivate many companies and industries to transfer the concept to their specific environments in order to further optimize their supply chains in the future.

Operations Management Pearson Higher Ed

From a supply chain perspective, often big differences exist between global raw material suppliers' approaches to supply their respective local markets. The progressing complexity of large centrally managed global supply networks and their often-unknown upstream ramifications increase the likelihood of undetected bottlenecks and inefficiencies. It is therefore necessary, to develop an approach to strategically master the upstream complexity of such networks from a holistic perspective, in order to align regional competitive priorities and supply chain structures. The research is set in the context of polyamide engineering thermoplastics in the automotive industry. Based on an initial industry analysis and a literature review, a conceptual framework is developed. The framework is matched with existing empirical and theoretical literature, as well as multiple case study analyses in the relevant supply market and a centrally managed global supply network. As a result, strategic group theory is transferred into the supply network management context, to allow for the consideration of upstream supply chain structures in the category strategy development process. The proposed approach introduces strategic groups of supply chains as a segmentation criterion for complex global supply networks, which enables the network-wide alignment of competitive priorities, flexibility requirements, and partnerships with suppliers. Supply chain-based category strategies can effectively reduce the complexity firms are facing in this context. The results of this research are applicable for certain types of global supply networks, and can be used for network alignment and strategy development. The approach can furthermore generate valuable insights useable for negotiation support with suppliers.
