In these systems, the subwoofer is wireless, but the surround speakers connect to the subwoofer via speaker cables. The soundbar produces the sound for the front left, center, and right channels, but sends bass and surround signals wirelessly to the subwoofer. The subwoofer routes the surround signals to the connected speakers.

The resistance value comes from a long coil of wire inside each speaker called a voice coil. A voice coil is a coil of wire that, when placed inside a magnetic field, makes the speaker move and produce sound when driven by an amplifier. Speakers contain a long wound loop of wire called a voice coil.

That means you need two amplifiers; one for surround sound and another for stereo. The surround amplifier (or receiver) needs to have pre-outs for the front-left and front-

right speakers that bypass the unit's own power amplification and output an analogue signal to the stereo amp. Pre-outs are pretty common on AV amps above £500 (we've listed some current models below).

A good 5.1-channel system will give you a full surround sound experience. Most DVD and Blu-ray™ media, some Super Audio CDs (SACDs), broadcast TV, and many streaming sources are in 5.1-channel format. Going to 7.1 channels improves the directionality of sound effects and helps you feel more of your entertainment.
