Japan, although now listed as the world's third-largest economy after that of the United States and China, has been too readily dismissed in the late 20th century as a spent force. This is as unfortunate as it is incorrect for a number of reasons. First, while the Peoples' Republic of China. is indeed growing and its markets are expanding, an enormous amount of the impetus for development as well as logistical support is coming from large numbers of Japanese corporations operating in the PRC. Major Japanese enterprises such as Toyota, Sony, and Honda are already in China or are in the process of establishing a presence there. The export of Japanese technology remains an important contribution to China's development. The benchmark of product quality within Asia and in some areas beyond has been set by Japanese industrial standards. This second edition of Historical Dictionary of Japanese Business contains a chronology, an introduction, appendixes, and an extensive bibliography. The dictionary section has over 800 cross-referenced entries on important personalities, Japanese businesses, politics, and economy,. This book is an excellent access point for students, researchers, and anyone wanting to know more about Japanese Business.

Amateur astronomy has changed beyond recognition in less than two decades. The reason is, of course, technology. Affordable high-quality telescopes, computer-controlled 'go to' mountings, autoguiders, CCD cameras, video, and (as always) computers and the Internet, are just a few of the advances that have revolutionized astronomy for the twenty-first century. Martin Mobberley first looks at the basics before going into an in-depth study of what's available commercially. He then moves on to the revolutionary possibilities that are open to amateurs, from imaging, through spectroscopy and photometry, to patrolling for near-earth objects – the search for comets and asteroids that may come close to, or even hit, the earth. The New Amateur Astronomer is a road map of the new astronomy, equally suitable for newcomers who want an introduction, or old hands who need to keep abreast of innovations. From the reviews: "This is one of several dozen books in Patrick Moore's "Practical Astronomy" series. Amid this large family, Mobberley finds his niche: the beginning high-tech amateur. The book's first half discusses equipment: computer-driven telescopes, CCD cameras, imaging processing software, etc. This market is changing every bit as rapidly as the computer world, so these details will be current for only a year or two. The rest of the book offers an overview of scientific projects that serious amateurs are carrying out these days. Throughout, basic formulas and technical terms are provided as needed, without formal derivations. An appendix with useful references and Web sites is also included. Readers will need more than this book if they are

considering a plunge into high-tech amateur astronomy, but it certainly will whet their appetites. Mobberley's most valuable advice will save the book's owner many times its cover price: buy a quality telescope from a reputable dealer and install it in a simple shelter so it can be used with as little set-up time as possible. A poor purchase choice and the hassle of setting up are why most fancy telescopes gather dust in their owners' dens. Summing Up: Highly recommended. General readers; lower- and upper-division undergraduates."(T. D. Oswalt, CHOICE, March 2005)

Intended for upper elementary and secondary teachers in all subject areas, this guide provides practical advice on determining the appropriate application of computer technology and on the selection of specific, subject-related computer-based instruction units. Under the heading of hardware and software, topics discussed include communicating with a computer, computer size, getting and using user's programs, translators and programming languages, and the elements of a program. The computer is analyzed in terms of its uses as instructor, laboratory, calculator, object of instruction, and instructor's aide. The selection of computer-based instructional units is described from the beginning of the selection process through final decision making. Individual papers then focus on uses of the computer in the following specific areas: art education, business education, instruction for the deaf and hard of hearing, elementary school, language arts, mathematics curriculum and instruction, music education, physical education, secondary science, natural science, and the social sciences. "Keys to Recognizing General Purpose Languages," and some primary sources of computer-based instructional units, are appended. (LMM)

First Published in 1973, The Writing Machine presents a comprehensive history of the typewriter. Michael Adler not only investigated the history of the machine but also started collecting typewriters, because of the difficulty of discovering what these old machines looked like. Then he found there were other collectors all over the world who supplied him with such a wealth of data that he had eventually to limit the scope of his 'history'. There are hundreds and hundreds of makes and models of 'conventional' front-stroke, type bar machines with four-row keyboards, but they were virtually all the same. It is the unconventional ones that are interesting, and it is on these that the author concentrates. The book is amusing as well as informative, and it ends with a complete catalogue of 'unconventional' typewriters manufactured up to the 1930s, when the 'conventional' machine had become universal. This book is a must read for anyone interested to learn about the writing machine.

William E. DePuy was likely the most important figure in the recovery of the United States Army from its collapse after the defeat in Vietnam. That is a rather large claim, and it suggests a precedence over a number of other distinguished officers, both his contemporaries and successors. But it is a claim that can be justified by the test of the "null hypothesis:" Could the Army that conducted the Gulf War be imagined without the actions of General DePuy and those he instructed and inspired? Clearly, it could not. There are a few officers of the period about whom one can make the same claim. To judge properly the accomplishments of General DePuy and his talented subordinates at the US Army Training and Doctrine Command (TRADOC), one must understand the sense of crises and defeat that pervaded the Army in the 1970s. By 1973, the United States had lost the war in Vietnam. Only the most optimistic or naïve observer held out hope that the Geneva Accords would provide security for the Republic of South Vietnam. The US Army was in a shambles, with discipline destroyed and the chain of command almost nonexistent. The "All Volunteer Army" was borne on a wave of permissiveness that compounded the problems of restoring discipline. Moreover, the army was ten years behind its most likely enemy in equipment development, and it had no warfighting doctrine worthy of the same. With the able assistance of the commander of the Armor Center, General Donn Starry, General DePuy wrenched the Army from self-pity and recrimination about its defeat in Vietnam into a bruising doctrinal debate that focused the Army's intellectual energies on mechanized warfare against a first-class opponent. Critics might argue correctly that that the result was incomplete, but they out not to underestimate how far the Army had to come just to begin the discussion. General DePuy also changed the way Army battalions prepared for war. He made the US Army a doctrinal force for the first time in history. Ably seconded by General Paul Gorman, DePuy led the Army into the age of the Army Training and Evaluation Program (ARTEP). The intellectual and training initiatives were joined then, with a third concern of General DePuy's TRADOC: the development of a set of equipment requirements, with a concentration of effort on a limited number, ultimately called the "Big Five." The result was the suite of weapons that overmatched the Iraqis in Operation Desert Storm – Apache attack helicopters, M1 tanks, Bradley fighting vehicles, Patriot air defense missiles, and Black Hawk assault helicopters. General DePuy championed the recruitment of a high-quality soldiery, an effort beyond his own significant responsibilities but, even so, one he never ceased to support and forward.
