Customer-driven manufacturing is the key concept for the factory of the future. The markets for consumer goods are nowadays marked by an increase in variety, while at the same time showing steadily decreasing product life-cycles. In addition, tailoring the product to the customer's needs is becoming increasingly important in quality improvement. These trends are resulting in production in small batches, driven by customer orders. Customer-driven Manufacturing adopts a design-oriented approach, splitting the realisation of customer-driven manufacturing into three main steps. Firstly, you must understand the primary process of your business. The second step is to analyse and re-design the management and control of the organisation. Finally, the organisation's information system must be analysed and redesigned.

Engineering for Business features teaching materials and case studies developed for senior undergraduate courses in engineering and business and graduate-level classes in Engineering Management, Industrial Engineering and Management, and Technology Management. This work surveys the more robust quantitative tools and techniques used to facilitate decision-making in business and uses case studies to illustrate their application. Where appropriate, the readers are provided with frameworks to enable application of the techniques covered and are directed to commercially available software developed to facilitate the deployment of these tools and techniques. Traditional industrial engineering and engineering management techniques related to Engineering Economy, Multi-Criteria Decision-making, Project Management, Management Science, and Facilities Planning are covered. These are complemented by a review of more topical areas, such as Applications Software for Business, Technology Commercialization, and Supply Chain Management. In all areas, the emphasis is on integrating theory and practice through the use of case studies based on projects conducted in a wide range of industry settings. Engineering for Business provides a robust framework for the explicit integration of engineering tools and techniques into a business curriculum. The case studies are rich in data and provide great opportunities for students to apply the techniques covered and to propose innovative solutions to open-ended project assignments.

The book shows how to use Planning by Design (PxD) for developing working models to any type of subject area. Section 1 describes the nature of planning in general, the formula of planning, the features that make it systematic, the essence of PxD, and developing and using the working model. Section 2 demonstrates personal application of creative planning to real life cases and practical working models on different subject areas. The book provides a general planning "master guide" that shows how to develop a working model of any definable subject matter. This objective will be accomplished by introducing the concepts, the process, and the methodology of PxD.
