The traditional approach is perhaps the most straightforward method for systems analysis and design, however, for even smaller projects; agile methods may be more desirable. However, if the project's goal is more heavily emphasized on project scalability and component reusability, object-oriented approach could be the best choice.

The Structured Systems Analysis and Design Method, or SSADM, is an

approach to designing and analyzing information systems. Developed in Britain in 1980, this method uses logical data modeling, entity event modeling and data flow modeling in a six-step process to determine how a system must be created or updated.

Object-oriented methodologies often focus on small, quick iterations of development, sometimes called the spiral model. Analysis is performed on a small part of the system, usually starting with a high-priority item or perhaps one that has the greatest risk. This is followed by design and implementation.
