vertebrates, including humans. Many experiments that have first been performed on lower vertebrates provided the tools and strategies that could later be applied to other less readily available mammalian systems. The discovery of centrosomes in ascidians and sea urchin eggs now benefits studies of fertility and infertility in mammals including humans. External in vitro fertilization, now

a common technique in assisted fertilization has only been possible as a result of numerous studies in lower systems in which external fertilization is natural. Egg activation, first explored in sea urchin and ascidian eggs, now benefits cloning efficiency in farm and domestic animals. Gene manipulations and molecular methods have added to the possibilities of producing live offspring with

enormous biomedical, ecological, and economic implications. All sexually reproducing organisms produce primordial germ cells, a small population of cells that differentiate into gametes of either sex that carry to-potency, an ability to develop into an entire new organism. The two volumes on germ cells combine techniques in a variety of different systems and have selected those

systems that have provided landmarks in advancing our knowledge on germ cells. Squirrel Monkeys Very Good Books As sports have become more competitive over recent years researchers and trainers have been searching for new and innovative ways of improving performance. Ironically, an area as mundane as what an athlete eats can have profound effects on fitness, health and ultimately,

performance in competition. Sports have also gained widespread acceptance in the therapeutic management of athletes with disorders associated with nutritional status. In addition, exercise has been one of the tools used for studying the control of metabolism, creating a wealth of scientific information that needs to be placed in the context of sports medicine and science. Nutrition in

Sport provides an exhaustive review of the biochemistry and physiology of eating. The text is divided into three sections and commences with a discussion of the essential elements of diet, including sections on carbohydrates, proteins, fats, vitamins and trace elements, and drugs associated with nutrition. It also discusses athletes requiring special consideration, including vegetarians and diabetics. The second section

---

considers the practical aspects of sports nutrition and discusses weight control (essential for sports with weight categories and athletes with eating disorders), the travelling athlete (where travel either disrupts established feeding patterns or introduces new hazards), environmental aspects of nutrition (including altitude and heat), and the role of sports nutritional products.

Carnivores are the focus of intense attention and resources in conservation biology. It is often argued that, because carnivores are at the top of the food chain, if they are protected, then other taxa will also be afforded adequate protection. Carnivores are

also charismatic and compete with humans for dwindling space and environmental resources. In the past 10 years, theoretical and empirical studies on carnivores have developed very quickly. This volume reviews and summarises the current state of the field, describes limitations and opportunities for carnivore conservation, and offers a conceptual framework for future research and applied management. As such it will be

---

of interest to students and researchers of conservation biology, mammalogy, animal behaviour, ecology and evolution.

This volume contains articles presented at the X International Symposium on Purines and Pyrimidines in Man, held on May 14-19, 2000 in Tel Aviv, Israel. The first symposium in this series took place in Tel Aviv in 1973. Since then, the symposium has been held every

three years in different parts of the world, including Europe, USA and Japan. The participants, in this series of symposia, are characterised by a wide interest in the various aspects of purines and pyrimidines in man, which include biochemistry, genetics, pharmacology, physiology, clinics, etc. Presentations in the symposia include clarification of metabolic pathways, characterisation of enzyme structure and kinetics and discoveries of new inborn errors of

metabolism and suggestions for new therapeutic approaches for these inborn errors. In addition, development of new purine and pyrimidine derivatives for the treatment of cancer and viral diseases, and many more subjects of mutual interest were brought to the fore. With the development of therapeutic means and of new research tools, we have witnessed changes in the areas of interest. The interest in gout and uric acid urolithiasis has lessened, whereas

---

molecular aspects, the role of purine and pyrimidine substances in neurotransmission and in purinergic signaling appear to gain greater interest. The articles, included in this volume, contain new data pertaining to the various aspects detailed above.

The mammalian  
order Carnivora is  
characterized by  
an incredible  
range of  
morphological,  
ecological, and  
behavioral  
variation.  
Carnivores can be  
as small as the  
100-gram least  
weasel or as large  
as the  
800-kilogram  
polar bear. Their  
reproductive rate  
can vary from one

offspring every five  
years, as with  
some black bears,  
to three litters a  
year, as with the  
dwarf mongoose.  
Group sizes can be  
traced along a  
wide continuum,  
from the solitary  
ermine to the  
monogamous  
golden jackal to  
the large extended  
packs of as many  
as 80 spotted

recently the  
general habits of  
most wild  
carnivore species

last decade,  
however,  
improved  
technologies,

| evolutionary characteristics of this group. After a general introduction to the Carnivora, the volume is divided in three parts, each of which begins with a brief introduction outlining its main themes. Part I, Behavior, covers acoustic and olfactory communication, behavioral development, behavioral ecology of canids and hyaenids, modes of solitary living, and group living. In Part II, Ecology, topics include feeding ecology of the giant panda | and Asiatic black bear, adaptations for aquatic living, ecological constraints on predation in felids, consequences of small size in mustelids, rate of basal metabolism and food habits, and reproductive output. Part III, Evolution, deals with the morphological approaches to phylogeny, and the fossil record. An appendix presents a complete classification of the Carnivora, including topics of continuing controversy. Highlighting recent | developments in the study of the Carnivora and areas for further research, this broad synthesis will be of great value of students and researchers in animal behavior, behavioral ecology, wildlife ecology, mammalogy, paleontology, systematics, and evolution theory. It will also encourage realistic conservation programs to manage rapidly diminishing populations and will elucidate particular features of the carnivores for nonspecialist |

limitations involved  
with designing  
these  
groundbreaking  
compounds.

Beginning with an  
introduction to  
hybrid molecule

background as to  
their need, the book  
goes on to explore a  
range of important  
hybrids, with  
hybrids containing  
natural products,  
molecules  
containing NO- and  
H2S-donors, dual-  
acting compounds  
acting as receptor  
ligands and enzyme  
inhibitors, and the

design of photoresponsive drugs all discussed. Drawing on practical case studies, the hybridization of molecules for development as treatments for a number of key diseases is then outlined, including the design of hybrids for Alzheimer's, cancer, and malaria. With its cutting-edge reviews of breaking developments in this exciting field, the book offers a novel approach for all those working in the design, development, and administration of drugs for a range of debilitating disorders.

Highlights an approach unimpaired by the limitations of the classical search for lead structures - one of the core problems in modern drug development processes, making the content of high relevance for both academic and non-academic drug development processes Pulls together research and design techniques in a novel way to give researchers the best possible platform from which to review the approaches and techniques applied Compares the advantages and disadvantages of these compounds

Includes the very latest developments, such as photoactivatable and photo-responsive drugs Ethnopharmacology in Central and Eastern Europe in the Context of Global Research Developments Elsevier Not another book on breadmaking! A forgiveable reaction given the length of time over which bread has been made and the number of texts which have been written about the subject. To study breadmaking is to realize that, like many other food

---

processes, it is constantly changing as processing methodologies become increasingly more sophisticated, yet at the same time we realize that we are dealing with a food stuff, the forms of which are very traditional. We can, for example, look at ancient illustrations of breads in manuscripts and paintings and recognize products which we still make today. This contrast of ancient and modern embodied in a single processed

foodstuff is part of what makes bread such a unique subject for study. We cannot, for example, say the same for a can of baked beans! Another aspect of the uniqueness of breadmaking lies in the requirement for a thorough understanding of the link between raw materials and processing methods in order to make an edible product. This is mainly true because of the special properties of wheat proteins, aspects of which are explored in most of the chapters of this

book. Wheat is a product of the natural environment, and while breeding and farming practices can modify aspects of wheat quality, we millers and bakers still have to respond to the strong influences of the environment.

than half a million copies of their books in print, Jeff Hertzberg and Zoë François have proven that people want to bake their own bread, so long as they can do it easily and quickly. Based on fan feedback, Jeff and Zoë have completely revamped their first, most popular, and now-classic book, *Artisan Bread in Five Minutes a Day*. Responding to their thousands of ardent fans, Jeff and Zoë returned to their test kitchens to whip up more delicious baking recipes. They've also included a gluten-free chapter, forty all-new gorgeous

color photos, and one hundred informative black-and-white how-to photos. They've made the "Tips and Techniques" and "Ingredients" chapters bigger and better than ever before, and included readers' Frequently Asked Questions. This revised edition also includes more than thirty brand-new recipes for Beer-Cheese Bread, Crock-Pot Bread, Panini, Pretzel Buns, Apple-Stuffed French Toast, and many more. There's nothing like the smell of freshly baked bread to fill a kitchen with warmth, eager appetites, and endless praise. Now,

The Handbook of Nonwoven Filter Media, Second Edition provides readers with a fundamental understanding of nonwoven filter media. It is one of the few books dealing exclusively with the subject, and is primarily intended as a reference for

people in the nonwovens industry (industry and academic researchers, technical, marketing , and quality control personnel) and universities offering courses in filtration theory and practice and nonwovens technology. The book includes applications for gas, liquid, and engine filtration, and identifies the types of filter media used in these applications. The various separation technologies that can be achieved with nonwoven

filter media are revealed and discussed. Theoretical presentation is based on flow through porous media, and is developed around a nonwovens or engineered fabrics orientation. Well-funded campaigns have spent years convincing you that some foods are good, some are bad, and some are downright evil. It doesn't have to be that way. Relax and Enjoy Your Food uses science and a little common sense to take away all that anxiety, and save you some money to boot. Once you let go of

---

some ideas, it all gets simpler. There are no superfoods, no junk foods, and there aren't even any health foods. There is just food, all of which provides some combination of the same seven basic things that all food does. That's why the most specific advice you can get is to eat a variety of foods, mostly plants, not too much or too little. That's it. The diet and wellness industries, along with the supplement industry, have deep pockets and ill intent. Their primary victims are women, but everybody gets caught up in their web. After reading this book you'll be able to leave all that behind, eat a healthy diet, even reach and maintain a healthy weight. In short, you'll be able to

relax and enjoy your food.

Fungi and microbes have predominant influence in our lives. They are directly or indirectly involved in generating the food we eat and drink, besides providing life saving pharmaceutical products, including the sources of enzymes. They play a vital role in recycling of organic matter and

several ecological processes. Both fungi and microbes have contributed several billion dollars worth of technological products. For instance: yeast is used in brewing and bakery, *Lactobacillus* ferments milk to yoghurt and a number of edible mushrooms are rich in nutrients besides possessing many medicinal properties. Bacteria and fungi serve as key organisms in understanding life processes, genetic engineering and as experimental organisms.

---

Therefore, it is necessary to study the biology and biotechnology of these organisms. It is a humble attempt of the authors to make the readers understand the biology and biotechnology of fungi and microbes in a simpler way and also to communicate the recent developments.
