William H. Starbuck is one of the most creative, productive, and wide-ranging writers in management and organization studies. His work spans three decades and encompasses a whole variety of issues, yet it has never been collected together in one place. This book does just that - bringing together his most seminal writings, prefaced by a personal reflection on some of the themes and conclusions of that emerge from this, and the context in which they were written. What emerges from this is a picture of organizations and their strategies that emphasizes the characteristics of real-life human beings: their idiosyncratic preferences, their distrust for each other, their struggle for dominance, their personal interests which don't always coincide with the interests of the organization, and the internal politicking and contests between interest groups that take place in organizations. Some chapters review research literature, some report empirical findings, some propose conceptual reformulations, and some offer advice to managers. This book will be a unique guide to the work of an influential thinker in management and organization studies, and will be of interest to academics, researchers, and students of management, strategy, and organization studies.

### Feedback Systems

The essential introduction to the principles and applications of feedback systems—now fully revised

---

and expanded This textbook covers the mathematics needed to model, analyze, and design feedback systems. Now more user-friendly than ever, this revised and expanded edition of *Feedback Systems* is a one-volume resource for students and researchers in mathematics and engineering. It has applications across a range of disciplines that utilize feedback in physical, biological, information, and economic systems. Karl Åström and Richard Murray use techniques from physics, computer science, and operations research to introduce control-oriented modeling. They begin with state space tools for analysis and design, including stability of solutions, Lyapunov functions, reachability, state feedback observability, and estimators. The matrix exponential plays a central role in the analysis of linear control systems, allowing a concise development of many of the key concepts for this class of models. Åström and Murray then develop and explain tools in the frequency domain, including transfer functions, Nyquist analysis, PID control, frequency domain design, and robustness. Features a new chapter on design principles and tools, illustrating the types of problems that can be solved using feedback Includes a new chapter on fundamental limits and new material on the Routh-Hurwitz criterion and root locus plots Provides exercises at the end of every chapter Comes with an electronic solutions manual An ideal textbook for undergraduate and graduate

---

students Indispensable for researchers seeking a self-contained resource on control theory
