Annual Report of the Board of Scientific Advice for India for the Year ... Read Books Ltd

This historic book may have numerous typos and missing text. Purchasers can usually download a free scanned copy of the original

book (without typos) from the publisher. Not indexed. Not illustrated. 1857 edition. Excerpt: ...Port wine was precipitated with acetate of lead, the precipitate washed, suspended in water, and sulphuretted hydrogen conducted through it, and the liquid afterwards filtered. After the sulphide of lead had been boiled with water, and the solution evaporated, the addition of solution of gelatine was not sufficient to produce a precipitate, but it was necessary to add acid. The result obtained was, that the yellow colouring matter of the Port wine agreed exactly with a portion

of the sediment deposited in the course of time. These properties agree entirely with those which Berzelius has published as peculiar to apothema of tannic acid. Pelouze found that a diluted solution of tannic acid becomes brownish yellow when exposed to the air; and any one who chooses to expose solution of tannic acid to the air, may, after a time, perceive the alteration in the colour, which appears darker or lighter according as the solution is more or less concentrated. This change is not, however, to be considered exactly the same as that which tannic acid

undergoes when exposed to heat; for, at the usual temperature, not only is colour changed, but gallic acid formed, and the discoloration may be viewed as partial decomposition of the sugar of tannic acid into ulmic acid, or some similar substance. Up to this time gallic acid has not been sought in that solution of tannic acid which has been rendered deep brown, by being heated during exposure to the air, otherwise it might perhaps have been discovered. Here, also, it can only be the sugar of the tannic acid which gives rise to a humus-like substance, which, in this case, combines with a portion of the tannic acid, and is thereby precipitated. What therefore is called apothema of tannic acid, is a humuslike...

This vintage book contains a complete manual of the constituents of the distilled spirits and fermented liquors of commerce, with extensive details of their qualitative and quantitative properties. It was originally intended as an outline of the basic chemistry of alcoholic liquors, and has been written in such a way as to be accessible to those with little scientific knowledge or background. This volume is recommended for those with an interest in the history and development of the alcohol industry, and would make for a valuable addition to collections of allied literature.

Contents include: "Alcohol, its Composition and Properties", "Generic Use of the Term Alcohol and the Variability of its Mixtures", "The Alcoholic Fermentation Proper; the Yeast Plant", "Formation of Succinic Acid and Glycerine

and other Alcohols", "Saccharine Fermentation", et cetera. Many vintage books such as this are increasingly scarce and expensive. We are republishing this volume now in an affordable, high-quality edition complete with a specially commissioned new introduction on cocktail and beverage making.
