There exists a concept that has captured the  
minds of countless individuals for years.

This is the idea that humans have evolved  
from an ape-like creature millions of years  
ago. This outwardly ridiculous notion has  
turned countless people away from the truth  
of human origins. Do humans really share a  
most recent common ancestor with the  
chimpanzee? Or do all humans today descend  
from just two people, Adam, and Eve, six  
thousand years ago? Why Human Evolution Is  
False: The Scientific Case For Independent  
Origins presents an irrefutable case against  
ape-to-man evolution using top level  
arguments and the most up to date research  
available! The author of this book, Standing  
For Truth, challenges all proponents of  
human evolution to counter the incredibly

undeniable evidence presented in this must-  
read book has massive implications. The data  
offered not only invalidates the human  
evolution fairy tale, but also confirms  
biblical creation and a literal Adam and  
Eve.

Princeton University Press

In this book the author, a Harvard evolutionary biologist presents an account of how the human body has evolved over millions of years, examining how an increasing disparity between the needs of Stone Age bodies and the realities of the modern world are fueling a paradox of greater longevity and chronic disease. It illuminates the major transformations that contributed key adaptations to the body: the rise of bipedalism; the shift to a non-fruit-based diet; the advent of hunting and gathering, leading to our superlative endurance athleticism; the development of a very large brain; and the incipience of

cultural proficiencies. The author also elucidates how cultural evolution differs from biological evolution, and how our bodies were further transformed during the Agricultural and Industrial Revolutions. While these ongoing changes have brought about many benefits, they have also created conditions to which our bodies are not entirely adapted, the author argues, resulting in the growing incidence of obesity and new but avoidable diseases, such as type 2 diabetes. The author proposes that many of these chronic illnesses persist and in some cases are intensifying because of 'dysevolution,' a pernicious dynamic whereby only the symptoms rather than the causes of these maladies are treated. And finally, he advocates the use of evolutionary information to help nudge, push, and sometimes even compel us to create a more salubrious environment. -- From publisher's web site.

**The Origin and Evolution of Primitive Man** Houghton Mifflin Harcourt

When it comes to evolution, most people are thumbs up, thumbs down, or even thumbs sideways. No matter where your thumb is pointing, you must ask the question: what is evolution? The U.S. Court System has witnessed seemingly endless litigation over this topic, yet it has used the term in major cases without clearly outlining a consistent and scientifically agreed upon definition. Public schools are required to teach it, but have also not outlined a scientifically agreed upon definition. State and federal educational agencies that create standard curricula frameworks have failed to offer a consistent and scientifically agreed upon definition of biological evolution. Public

educators are free to teach evolution based on the direction their thumbs are pointed. This reality has placed the future of science at risk. How logical is it for our nation's educational framework to require biological evolution, but not require a standard definition? If Theodosius Dobzhansky is correct in saying that "nothing in biology makes sense except in the light of evolution," then what is evolution? 47 Minutes on Christmas Eve Jupiter Kids

"An essential read for anyone interested in the stories of the animals in our home or on our plate."—BBC Focus Without our

domesticated plants and animals, human civilization as we know it would not exist.

We would still be living at subsistence level as hunter-gatherers if not for domestication. It is no accident that the cradle of civilization—the Middle East—is where sheep, goats, pigs, cattle, and cats commenced their fatefully intimate association with humans. Before the

agricultural revolution, there were perhaps 10 million humans on earth. Now there are more than 7 billion of us. Our domesticated species have also thrived, in stark contrast to their wild ancestors. In a human-constructed environment—or man-made world—it pays to be domesticated. Domestication is an evolutionary process first and foremost.

What most distinguishes domesticated animals from their wild ancestors are genetic alterations resulting in tameness, the capacity to tolerate close human proximity. But selection for tameness often results in a host of seemingly unrelated by-products, including floppy ears, skeletal alterations, reduced aggression, increased sociality, and reduced brain size. It's a package deal known as the domestication syndrome.

Elements of the domestication syndrome can be found in every domesticated species—not only cats, dogs, pigs, sheep, cattle, and horses but also more recent human creations, such as domesticated camels, reindeer, and laboratory rats. That domestication results in this suite of changes in such a wide variety of mammals is a fascinating evolutionary story, one that sheds much light on the evolutionary process in

---

general. We humans, too, show signs of the domestication syndrome, which some believe was key to our evolutionary success. By this view, human evolution parallels the evolution of dogs from wolves, in particular. A natural storyteller, Richard C. Francis weaves history, archaeology, and anthropology to create a fascinating narrative while seamlessly integrating the most cutting-edge ideas in twenty-first-century biology, from genomics to evo-devo.

" 'Garniss, lend me your knife for a second, will you,' I whispered." So begins Java Man, the inside story of how one discovery—a human skull found on the island of Java—by two geologists shook the foundations of science. By uncovering new evidence about the hominid known as Java man, Carl C. Swisher and Garniss H. Curtis were able to date his fossil remains at 1.7 million years, an age that stunned the scientific community because it pushed back the time when humans migrating out of Africa first reached Eurasia by nearly one million years. Cowritten by the popular science writer Roger Lewin, this is a gripping and informative account of the discovery that breathed new life into the human origins debate.
