Set in the days of the Empire, with the British ruling in Burma, *Burmese Days* describes both indigenous corruption and Imperial bigotry, when 'after all, natives were natives - interesting, no doubt, but finally only a "subject" people, an inferior people with black faces'. Against the prevailing orthodoxy, Flory, a white timber merchant, befriends Dr

Veraswami, a black enthusiast for Empire. The doctor needs help. U Po Kyin, Sub-divisional Magistrate of Kyauktada, is plotting his downfall. The only thing that can save him is European patronage: membership of the hitherto all-white Club. While Flory prevaricates, beautiful Elizabeth Lackersteen arrives in Upper Burma from Paris. At last, after years of 'solitary hell', romance and marriage appear to offer Flory an escape from the 'lie' of the 'pukka sahib pose'.

This is the first book that attempts to answer this important question by applying neural network theory. Scientists create Artificial Neural Networks (ANNs) to make models of the brain. These networks mimic the architecture of a nervous system by connecting

---

elementary neuron-like units into networks in which they stimulate or inhibit each other's activity in much the same way neurons do. This book shows how scientists can employ ANNs to analyze animal behavior, explore the general principles of the nervous systems, and test potential generalizations among species. The authors focus on simple neural networks to show how ANNs can be investigated by math and by computers. They demonstrate intuitive concepts that make the operation of neural networks more accessible to nonspecialists. The first chapter introduces various approaches to animal behavior and provides an informal introduction to neural networks, their history, and their potential advantages. The second chapter reviews artificial neural networks, including biological foundations, techniques, and applications. The following three chapters

apply neural networks to such topics as learning and development, classical instrumental condition, and the role of genes in building brain networks. The book concludes by comparing neural networks to other approaches. It will appeal to students of animal behavior in many disciplines. It will also interest neurobiologists, cognitive scientists, and those from other fields who wish to learn more about animal behavior.

First paragraph of Preface: This work is designed to serve as a systematic textbook of animal behavior for courses in psychology

and biology. Part I covers the behavior of animals below the mammals, a comparative treatment in which we have endeavored not only to characterize each important animal type but also to work out certain fundamental principles of animal adjustment. In Parts II and III these principles are developed further as the major problems of animal psychology are attacked in connection with the behavior of mammals.

appropriate for both non-science and science majors.

First paragraph of preface: The fundamental propositions behind this text—the platform, so to speak, upon which it has been written—are as follows: 1. Life has a chemico-physical basis. 2. Life phenomena are the outgrowth of organization. 3. The central fact in life is metabolism. 4. Animals may be arranged in a progressive series with reference to organization. 5. The most complex animals are the most effective and also the most efficient from a metabolic standpoint. 6. Man, as the highest of animals, can learn by the study of animal life the principles of the most effective living.

---

7. He can also understand more fully his place in nature and can more justly judge the actions of his fellows; this in turn may contribute to his intellectual and spiritual development. 8. Every problem concerned with living is essentially a biological problem and capable of analysis and solution by the application of biological principles.

Grade 6, unit 26 McGraw-Hill/Glencoe

Designed for a one-semester introductory course in Animal Behavior. Animal behavior is a broad discipline with investigators and contributions from diverse perspectives, including anthropology, comparative psychology, ecology, ethology, physiology, and zoology. The authors goal in this textbook is to use evolutionary principles as a unifying theme to provide students exposure to a number of approaches to the field of animal behavior.

They also demonstrate that the varied perspectives used to study behavior are complementary and often integrated; they are not mutually exclusive. The subtitle, “ Mechanisms, Ecology, and Evolution, ” reflects the broad themes that dominate the book.
