How can we
make better
sense of
animal
behavior by
using what we
know about
the brain?
This is the
first book
that attempts
to answer
this
important
question by
applying
neural
network
theory.
Scientists
create
Artificial
Neural
Networks
(ANNs) to
make models
of the brain.
These
networks

mimic the
architecture
of a nervous
system by
connecting
elementary
neuron-like
units into
networks in
which they
stimulate or
inhibit each
other's
activity in
much the same
way neurons
do. This book
shows how
scientists
can employ
ANNs to
analyze
animal
behavior,
explore the
general
principles of
the nervous
systems, and
test

potential gene

among
species. The
authors focus
on simple
neural
networks to
show how ANNs
can be
investigated
by math and
by computers.
They
demonstrate
intuitive
concepts that
make the
operation of
neural
networks more
accessible to
nonspecialist
s. The first
chapter
introduces
various
approaches to
animal
behavior and

provides an informal introduction to neural networks, their history, and their potential advantages. The second chapter reviews artificial neural networks, including biological foundations, techniques, and applications. The following three chapters apply neural networks to such topics as learning and

development, classical instrumental condition, and the role of genes in building brain networks. The book concludes by comparing neural networks to other approaches. It will appeal to students of animal behavior in many disciplines. It will also interest neurobiologists, cognitive scientists, and those from other

fields who wish to learn more about animal behavior.

Course C McGraw-Hill

Set in the days of the Empire, with the British ruling in Burma, *Burmese Days* describes both indigenous corruption and Imperial bigotry, when 'after all, natives were natives - interesting, no doubt, but finally only a "subject" people, an inferior people with black faces'. Against the prevailing orthodoxy, Flory, a white timber merchant,

befriends Dr Veraswami, a black enthusiast for Empire. The doctor needs help. U Po Kyin, Sub-divisional Magistrate of Kyauktada, is plotting his downfall. The only thing that can save him is European patronage: membership of the hitherto all-white Club. While Flory prevaricates, beautiful Elizabeth Lackersteen arrives in Upper Burma from Paris. At last, after years of 'solitary hell', romance and marriage appear to offer Flory an escape from the 'lie'

of the 'pukka sahib pose'.

preface: The fundamental propositions behind this text--the platform, so to speak, upon which it has been written--are as follows: 1. Life has a chemico-physical basis. 2. Life phenomena are the outgrowth of organization. 3. The central fact in life is metabolism. 4. Animals may be arranged in a progressive series with reference to organization. 5. The most complex animals are the most effective and also the most efficient from a metabolic standpoint. 6. Man, as the highest of animals,

can learn by the study of animal life the principles of the most effective living. 7. He can also understand more fully his place in nature and can more justly judge the actions of his fellows; this in turn may contribute to his intellectual and spiritual development. 8. Every problem concerned with living is essentially a biological problem and capable of analysis and solution by the application of biological principles.

First paragraph of Preface: This work is designed to serve as a systematic textbook of animal behavior for courses in psychology and biology. Part I covers the behavior of animals below the mammals, a comparative treatment in which we have endeavored not only to characterize each important animal type but

also to work out certain fundamental principles of animal adjustment. In Parts II and III these principles are developed further as the major problems of animal psychology are attacked in connection with the behavior of mammals.

Animal Behavior: Mechanisms, Ecology, Evolution Tata McGraw-Hill Education
Designed for a one-semester introductory course in Animal Behavior. Animal behavior is a broad discipline with investigators and contributions from diverse perspectives,

including anthropology, comparative psychology, ecology, ethology, physiology, and zoology. The authors goal in this textbook is to use evolutionary principles as a unifying theme to provide students exposure to a number of approaches to the field of animal behavior. They also demonstrate that the varied perspectives used to study behavior are complementary and often integrated; they are not mutually exclusive. The subtitle, "Mechanisms,

Ecology, and Evolution," reflects the broad themes that dominate the book.

The Animal Kingdom McGraw-Hill/Glencoe Laboratory Studies in Animal Diversity offers students hands-on experience in learning about the diversity of life. It provides students the opportunity to become acquainted with the principal groups of animals and to recognize the unique anatomical features that characterize each group as well as the patterns that link animal groups to each other. A top choice among students and instructors alike,
Animal Diversity continues to earn the appreciation of both science majors and non-majors alike.
The book uses the theme of evolution to develop a broad-scale view of animal diversity—students focus not only the organisms themselves, but also the processes that produce evolutionary diversity. The book is unique in its
