Bees provide a critical link in the maintenance of ecosystems, pollination. They play a major role in maintaining biodiversity, ensuring the survival of many plants, enhancing forest regeneration, providing sustainability and adaptation to climate change and improving the quality and quantity of agricultural production systems. In fact, close to 75 percent of the world's crops that produce fruits and seeds for human consumption depend, at least in part, on pollinators for sustained production, yield and quality. Beekeeping, also called apiculture, refers to all activities concerned with the practical management of social bee species. These guidelines aim to provide useful information and suggestions for a sustainable management of bees around the world, which can then be applied to project development and implementation.

Understanding the biology of flora and its value to honey bees is the core foundation for successful beekeeping. Bees feed on nectar and pollen. No food equals no bees! The flowers on which bees forage have a major impact on stocking rates and the level of nutrition available to the colony, two subjects that need to be understood for a beekeeper to be successful. Whether a beekeeper owns one hive or a thousand, the principle is the same. Floral resources within Australia underpin so many systems and animal species. Building knowledge and understanding of what they are, and how they are adapting to a changing climate, is a critical field of scientific endeavour. This publication is part of the journey to focus on the value of plants to nectarivores and honey bees in particular. The result of over 30 years of research, it distils both scientific knowledge and the opinions of hundreds of beekeepers into a reference work that will be the cornerstone of floral understanding in apiculture for years to come.

Practical Beekeeping in New Zealand Food & Agriculture Org

For more than 25 years Practical Beekeeping in New Zealand has been the bible for New Zealand beekeepers. The only comprehensive guide to keeping bees in New Zealand, it provides both amateur and professional beekeepers with details on honey bee management throughout the year, advice on handling hive products and information about many other beekeeping subjects. As well as being a guide to beekeepers, Practical Beekeeping in New Zealand appeals to those interested in apiculture and deciding whether to keep bees, and horticulturalists and farmers find it of particular interest for crop pollination. Given New Zealand's reputation in world beekeeping the book has also been keenly sought after by beekeepers overseas. Three editions of the book have been published since 1984. It has now been comprehensively updated to incorporate the latest information available, particularly on new approaches to beekeeping now the parasitic varroa mite has become established in New Zealand and changed the face of beekeeping forever.

A Manual for Trainers of Small Scale Beekeeping Development Workers Beekeeping

Beekeepers are unusual, as their activity (which is often "just a hobby") is the production of food that may be sold to the public. Many will see the process through from the very beginning - making hives, sourcing bees, setting up apiaries, and managing the bees, right through all stages of harvest, processing, packing, labelling, to retail

sale. Training is usually through local beekeeping associations, who often use a curriculum set by the British Beekeepers Association; this focuses on the practical sides of beekeeping, husbandry and the like, and it is intended to lead on to further study with Modules, and even the National Bee Diploma, the pinnacle of the possible qualification. The BBKA's Module 2 assessment includes food production and hygiene: the "bee press" occasionally have articles or a mention. There is little reliable guidance for beekeepers on the food production side, which is quite surprising. Although many beekeepers are hobbyists, with a few hives, and very limited sales, many have a number of hives. Of course, there are also bee farmers with many hives, producing significant quantities of honey and related products in commercial quantities. It's surprisingly easy to progress from a couple of hives to several, to having many! There are often enquiries on social media about honey, processing, or legal requirements. The sometimes less-than-expert responses often perpetuate old practices or information, which were not always correct to start with. For instance, I've seen it stated that in order to label honey with its botanical origin, it needs to contain variously 40% through to 70% of that nectar; but neither of these numbers is mentioned in the UK legislation. Another misrepresentation is that you don't need to register as a food business if premises are used for less than five days in five consecutive weeks: this is based on the Food Premises (Registration) Regulations 1991. However, these were superseded by Retained Regulation (EC) 852/2004, which contained no such exemption; there's full information in the relevant paragraph.
