by W. Jacquelyne Kious and Robert I. Tilling, published by the U.S. Geological Survey (USGS) in Denver, Colorado. Posts contact information via mailing address, telephone and fax numbers, and e-mail. Notes that a hard copy of the publication is available. Provides a table of contents and endnotes. Links to the USGS home page. *Orphaned Landscapes* Penguin UK Provides comprehensive overviews of

Indonesia's people, geography, history, government, economy, and culture. Abundant full colour illustrations guide the reader on a voyage of discovery. Maps reflect current political boundaries. *Heritage, Culture and Society* Inner Traditions A cutting-edge resource that examines Indonesia and the Malay-Speaking Muslim world. One of a series of eleven small books reporting on the emergence of the

Christian Church in unlikely places all around the world. The books are built from months of interviewing and emailing sources and cross-checking with them. Each book is just 64 pages, but tries to get to the core of the story. *The Bronze-Iron Age of Indonesia* Springer FBI Fly Team: The Rim on Fire by Ali Myers is an edge-of-your-seat thriller about an intensely trained group of counter-terrorism experts who discover a deadly terrorist cell in Indonesia. *An Outline of the Geology of*

Indonesia BRILL

This book is an excellent resource for scientists, political decision makers, and students interested in the impact of peatlands on climate change and ecosystem function, containing a plethora of recent research results such as monitoring-sensing-modeling for carbon–water flux/storage, biodiversity and peatland management in tropical regions. It is estimated that more than 23 million hectares (62 %) of the total global tropical peatland area are located in Southeast Asia, in lowland or

coastal areas of East Sumatra, Kalimantan, West Papua, Papua New Guinea, Brunei, Peninsular Malaysia, Sabah, Sarawak and Southeast Thailand. Tropical peatland has a vital carbon–water storage function and is host to a huge diversity of plant and animal species. Peatland ecosystems are extremely vulnerable to climate change and the impacts of human activities such as logging, drainage and conversion to agricultural land. In Southeast Asia, severe episodic droughts associated with the El Niño-

Southern Oscillation, in combination with over-drainage, forest degradation, and land-use changes, have caused widespread peatland fires and microbial peat oxidation. Indonesia's 20 Mha peatland area is estimated to include about 45–55 GtC of carbon stocks. As a result of land use and development, Indonesia is the third largest emitter of greenhouse gases (2–3 Gtons carbon dioxide equivalent per year), 80 % of which is due to deforestation and peatland loss. Thus, tropical peatlands are key ecosystems in terms of the carbon–water cycle and climate change.

cooking, the recipes exotic yet achievable, and the food brought to life by stunning photography.

Volcanoes of

Indonesia Carson-

Dellosa Publishing

This comprehensive book addresses the pressing need for up-to-date literature on volcanic destinations (active and dormant) and their role in tourism worldwide in chapters and case studies. The book presents a balanced view about the volcano-based tourism sector worldwide and discusses important issues such as the different volcanic hazards, potential for disasters and accidents and safety recommendations for visitors. Individual

chapters and case studies are contributed by a number of internationally based co-authors, with expertise in geology, risk management, environmental science and other relevant disciplines associated with volcanoes. Also covered are risk aspects of volcano tourism such as risk perception, risk management and public safety in volcanic environments. Discussions of the demand for volcano tourism, including geotourism and adventure tourism as well as some historical facts related to volcanoes, with case studies of interesting socio-cultural settings are included.

Indonesia Grove

Press

This book contains 12 chapters dealing with the studies on volcanoes, their geological and geophysical setting, the theoretical aspects and the numerical modeling on volcanoes, the applications of volcanoes to the industry, and the impact of volcanoes on the human health, in different geological settings and using several techniques and methods, including the volcanology, the seismology, the statistical methods to assess the correlation between seismic and volcanic activity (modified Ripley's K-function to

regional seismicity), the field geological survey of volcanic successions, the analytical methods of petrologic analysis, the petrography of the volcanic rocks with the individuation of the modal compositions of volcanic rocks and their comparison with major elements and trace elements in variation diagrams, and the argon isotopic measurements performed through the peak height comparison (unspiked) method. The oceanographic methods have also been applied to case studies of submarine volcanic edifices located in the Canary Islands (Atlantic Ocean), including the sampling of the water column with a conductivity-temperature-depth (CTD) sensor rosette with 24 Niskin bottles, in order to determinate key physical and chemical parameters, such as the total-scale pH, the total dissolved inorganic carbon (C), the total alkalinity (A), the temperature, the salinity, and the dissolved oxygen. Problems of volcanic risk mitigation have also been treated, regarding the eruption disasters in Indonesia, a country where a high number of people live next to the volcanoes, and characterized by the lack of public awareness of the eruption disasters. Petrographic methods have been successfully applied to the study of the Cretaceous magmatism of the layered gabbroids of the Chukotka region (Pekulney Ridge, Russia), and geodynamic implications have been successfully established through geological and petrographic studies. The relationships among the mantle wedge, the convective heat and mass transfer, the infiltration metasomatism, the

zoning, and the mathematical models have been applied to the comprehension of complex volcanic areas through the theoretical aspects of volcanic studies on magmatic chambers coupled with numerical modeling, including finite element models (FEMs) in the individuation of volcanic deformations.

In the Time of

Madness Editions

Didier Millet

Fire in the wet tropical climate of Indonesia is not a new phenomenon. The 'Great Fire of Borneo' in 1982-83 was one of the worst fire events in recent decades. Small holders clearing land

for cultivation were primarily blamed for starting fires that rapidly spread out of control. Subsequent fires linked to El Nino-Southern Oscillation occurred in 1987, 1991 1994 and most recently in 1997-98. The impact of the latest fire event is immense; estimates of the area burnt in 1997 vary between two and five million hectares (forest and non-forest), the number of people affected by smoke haze and fire at 75 million and the total economic costs in the region at as much as US\$4.5 billion. The 1982-83 fires brought the issue to world attention. After 1992 three long-term projects were initiated with the objectives of management and monitoring of fires.

These were the EU-Forest Fire Prevention and Control Project in Southern Sumatra (1995-1998), GTZ's Integrated Forest Fire Management Project in East Kalimantan (1994-2000), and JICA's Forest Fire Prevention and Management Project in Bogor, Jambi and West Kalimantan (1996-2001). In addition, the Indonesia-UK Tropical Forest Management Programme started in 1992 and comprised a number of components related to fires as part of its overall improved forest management objective. After the 1997 fires numerous short- and long-term fire projects were proposed and started. Others, such as the first phase of the

WWF project and the ADB's regional (RETA) and national (ADTA) projects, within a short time frame try to cover many aspects of fire problem such as socio-economic assessments, fire-fighting, area estimates, economic and policy assessments and ecological assessments. Representing a longer-term approach, CIFO R-ICRAF-UNESCO propose an in-depth study of the underlying causes and effects of fires. In addition to the international response Indonesia has several government agencies charged with the task of preventing, monitoring and controlling land and forest fires. Following the forest and land

fires of 1994, the National Coordination Team for Land and Forest Fire Control was established in 1995. Interest in fire is only short-lived after a major fire event. Before the 1994 fires little attention was paid to the fire problem and missions mainly focussed on control and prevention of fires. Most of the new generation of fire projects established in 1997-98 address both issues.

Cascadia's Fault

Channel View Publications

A thrillingly rendered, yet "level-headed" look at the Cascadia Subduction Zone and the devastating natural disasters it promises (Booklist) There is a crack in

the earth's crust that runs roughly 31 miles offshore, approximately 683 miles from Northern California up through Vancouver Island off the coast of British Columbia. The Cascadia Subduction Zone has generated massive earthquakes over and over again throughout geologic time—at least thirty-six major events in the last 10,000 years. This fault generates a monster earthquake about every 500 years. And the monster is due to return at any time. It could happen 200 years from now, or it could be tonight. The Cascadia Subduction Zone is

virtually identical to the offshore fault that wrecked Sumatra in 2004. It will generate the same earthquake we saw in Sumatra, at magnitude nine or higher, sending crippling shockwaves across a far wider area than any California quake. Slamming into Sacramento, Portland, Seattle, Victoria, and Vancouver, it will send tidal waves to the shores of Australia, New Zealand, and Japan, damaging the economies of the Pacific Rim countries and their trading partners for years to come. In light of recent massive quakes in

Haiti, Chile, and Mexico, Cascadia's Fault not only tells the story of this potentially devastating earthquake and the tsunamis it will spawn, it also warns us about an impending crisis almost unprecedented in modern history. **FBI Fly Team** CRC Press Laki is Iceland's largest volcano. Its eruption in 1783 is one of history's great, untold natural disasters. Spewing out sun-blocking ash and then a poisonous fog for eight long months, the effects of the eruption lingered

across the world for years. It caused the deaths of people as far away as the Nile and created catastrophic conditions throughout Europe. Island on Fire is the story not only of a single eruption but the people whose lives it changed, the dawn of modern volcanology, as well as the history and potential of other super-volcanoes like Laki around the world. And perhaps most pertinently, in the wake of the eruption of another Icelandic volcano,

Eyjafjallajokull, which closed European air space in 2010, acclaimed science writers Witze and Kanipe look at what might transpire should Laki erupt again in our lifetime.

A Review of Fire Projects in Indonesia, 1982-1998 Allen & Unwin

The author examines natural disasters around the Pacific Rim throughout history together with scientific data context to produce enlightening—and highly readable—entries. On March 11, 2011, a magnitude 9.0 earthquake struck off Japan's coast, triggering a powerful tsunami. The massive destruction that

resulted proved that not even sophisticated, industrialized nations are immune from nature's fury. Written to take some of the mystery out of the earth's behavior, this encyclopedia chronicles major natural disasters that have occurred around the Pacific Rim, an area nicknamed the "Ring of Fire" because of the volatile earth that lies above and below. The encyclopedia offers descriptions of deadly earthquakes, volcanic eruptions, and tsunamis through time. The entries provide in-depth information that promotes an understanding of the structure of the earth and earth processes and shares the insights of scientists whose

work helps clarify the causes and effects of these cataclysmic events. At the same time, the work examines how the people and cultures of the Pacific Rim view this active part of the earth, how they live with the threat of disaster, and how they have been affected by major events that have occurred. Readers will come away with a holistic view of what is known, how this knowledge was gained, and what its implications may be. *Tourism, Culture and Development* IDRC Simon Winchester's brilliant chronicle of the destruction of the Indonesian island of Krakatoa in 1883 charts the birth of our modern world. He tells the

story of the unrecognized genius who beat Darwin to the discovery of evolution; of Samuel Morse, his code and how rubber allowed the world to talk; of Alfred Wegener, the crack-pot German explorer and father of geology. In breathtaking detail he describes how one island and its inhabitants were blasted out of existence and how colonial society was turned upside-down in a cataclysm whose echoes are still felt to this day.

BESTSELLER •
A searing, post-apocalyptic novel about a father and son's fight to survive, this "tale of survival and the miracle of goodness only adds to McCarthy's stature as a living master. It's gripping, frightening and, ultimately, beautiful" (San Francisco Chronicle). • From the bestselling author of *The Passenger* A father and his son walk alone through burned America. Nothing moves in the ravaged landscape save the

ash on the wind. It is cold enough to crack stones, and when the snow falls it is gray. The sky is dark. Their destination is the coast, although they don't know what, if anything, awaits them there. They have nothing; just a pistol to defend themselves against the lawless bands that stalk the road, the clothes they are wearing, a cart of scavenged food—and each other. *The Road* is the profoundly moving story of a journey. It boldly imagines a future in which no hope remains, but in
