Analysis of the IRAS low resolution spectra show that the 8-22 micron spectral range show a variety of emission features. The strongest features in spectra of M stars are the 10 and 18 micron silicate emission features. In addition a three-component feature with peaks at 10, 11 and 13.1 micron and a weak, broad 9-15 micron feature is present in many M variable stars. Most carbon stars show the 11.2 micron SiC emission feature as well as, in some cases, an unidentified 8-9 micron emission feature. The MS, S and SC stars show a range of emission features whose peaks

range from 10 to 11.2 micron. The excess emission above the underlying photospheric continuum in the 8-22 micron region for S Mira variables shows a sharp increase for period greater than about 370 days.

Kevin A. Codd's previous book, *To the Field of Stars*, has been hailed as a contemporary classic of pilgrim literature and introduced a fresh voice to the world of both travel and

spiritual writing. In *Beyond
Even the Stars*, the reader is
invited to join this
peripatetic American priest
as he takes up the Way to

Leuven, Belgium, and follows
it south through much of

along the way are delightful,
just as his profound
reflections on life and
death, love and faith, God
and grace, are inspiring.
