thermodynamics has much
wider applicability. In
material science, one is
normally not that interested
in heat and work, but
interested more the state of
matter and how things
might change when mixed,
heated, pressurized, etc.

Some important effects are
chemical reactions (such as
oxidation), formation of
solutions, phase
transformations.

While there is some literature on fatigue crack growth in pipeline steels exposed to electrochemically generated hydrogen in aqueous solutions, this paper will only briefly discuss such results. However, hydrogen embrittlement should follow Sievert ' s law and will be influenced by the concentration of atomic hydrogen absorbed in the metal.

Natural clays have been used in ancient and modern medicine, but the mechanism(s) that make certain clays lethal against bacterial pathogens has not been identified. We have compared the depositional environments, mineralogies, and chemistries of clays that exhibit antibacterial effects on a broad spectrum of human pathogens including antibiotic resistant strains.
