Child prodigies. Gifted and Talented Programs. Perfect 2400s on the SAT. Sometimes it feels like the world is conspiring to make the rest of us feel inadequate. Those children tapped as possessing special abilities will go on to achieve great things, while the rest of us have little chance of realizing our dreams. Right? In Ungifted, cognitive psychologist Scott Barry Kaufman—who was relegated to special education as a child—sets out to show that the way we interpret traditional metrics of intelligence is misguided. Kaufman explores the latest research in genetics and neuroscience, as well as evolutionary, developmental, social, positive, and cognitive psychology, to challenge the conventional wisdom about the childhood predictors of adult success. He reveals that there are many paths to greatness, and argues for a more holistic approach to achievement that takes into account each young person's personal goals, individual psychology, and developmental trajectory. In so doing, he increases our appreciation for the intelligence and diverse strengths of prodigies, savants, and late bloomers, as well as those with dyslexia, autism, schizophrenia, and ADHD. Combining original research, anecdotes, and a singular compassion, Ungifted proves that anyone—even those without readily observable gifts at any single moment in time—can become great.

Science is increasingly defined by multidimensional collaborative networks. Despite the unprecedented growth of scientific collaboration around the globe – the collaborative turn – geography still matters for the cognitive enterprise. This book explores how geography conditions scientific collaboration and how collaboration affects the spatiality of science. This book offers a complex analysis of the spatial aspects of scientific collaboration, addressing the topic at a number of levels: individual, organizational, urban, regional, national, and international. Spatial patterns of scientific collaboration are analysed along with their determinants and consequences. By combining a vast array of approaches, concepts, and methodologies, the volume offers a comprehensive theoretical framework for the geography of scientific collaboration. The examples of scientific collaboration policy discussed in the book are taken from the European Union, the United States, and China. Through a number of case studies the authors analyse the background, development and evaluation of these policies. This book will be of interest to researchers in diverse disciplines such as regional studies, scientometrics, R&D policy, socio-economic geography and network analysis. It will also be of interest to policymakers, and to managers of research organisations.

Neuroscience has made phenomenal advances over the past 50 years and the pace of discovery continues to accelerate. On June 25, 2008, the Institute of Medicine (IOM) Forum on Neuroscience and Nervous System Disorders hosted more than 70 of the leading neuroscientists in the world, for a workshop titled "From Molecules to Minds: Challenges for the 21st Century." The objective of the workshop was to explore a set of common goals or "Grand Challenges" posed by participants that could inspire and rally both the scientific community and the public to consider the possibilities for neuroscience in the 21st century. The progress of the past in combination with new tools and techniques, such as neuroimaging and molecular biology, has positioned neuroscience on the cusp of even greater transformational progress in our understanding of the brain and how its inner workings result in mental activity. This workshop summary highlights the important issues and challenges facing the field of neuroscience as presented to those in attendance at the workshop, as well as the subsequent discussion that resulted. As a result, three overarching Grand Challenges emerged: How does the brain work and produce mental activity? How does physical activity in the brain give rise to thought, emotion, and behavior? How does the interplay of biology and experience shape our brains and make us who we are today? How do we keep our brains healthy? How do we protect, restore, or enhance the functioning of our brains as we age?

Educational Research and Professional Learning in Changing Times reports three dimensions of a longitudinal Australian study with the ultimate aim of improving the mathematics learning outcomes for all middle school students in preparation for the quantitative literacy requirements of the 21st century. It was also hoped to improve the prospects for students with the interest to study further mathematics. The project provided professional learning opportunities for teachers, carried out case studies in individual schools, produced well-documented classroom activities in line with the aims, and measured teacher and student change over three years. The three main sections of the book cover the formal data collection and analysis, the qualitative analysis of the case studies, and some of the professional learning activities for teachers. The final section reports the reflections of the authors, especially in relation to the changing educational environment in which the project took place. Many other countries are experiencing similar educational change. The book will supplement other resources for graduate programs for pre-service and in-service mathematics teachers by modeling both a realistic approach to quantitative and qualitative research and a range of practical classroom activities. It will also assist those providing professional learning for teachers in the field unrelated to formal research, as two thirds of the content is based on classroom experiences with mathematics.

The classic story about the power of words. Donavan Allen doesn't collect coins, comics, or trading cards like most kids. He collects words—big words, little words, soft words, and silly words. Whenever Donavan finds a new word, he writes it on a slip of paper and puts it in his word jar. But one day, Donavan discovers that his word jar is full. He can't put any new words in without taking some of the old words out—and he wants to keep all his words. Donavan doesn't know what to do, until a visit to his grandma provides him with the perfect solution.

If any country was born to holiday, it's Australia.Sun, space, beaches - the desire to hit the road and "get out of town" remains a strong and enduring part of our cultural identity. Many of us remember the summer ritual of packing up the car with half the stuff we owned and heading for our chosen "spot" in often incident-packed road trips.Central to those memorable journeys was the motel. "We'll stay a night in Gundagai," Dad would say, to break up the trip. Discovering the configuration of a new motel was all part of the holiday adventure - did it have a colour TV? The little packs of cereal? A couple of complimentary Arrowroots to go with the free tea and coffee? Bricks on the inside as well as the out?In his new book Motel, Tim Ross captures the heyday of Australia's motels via a deep trawl through the National Archives, presenting a fascinating slideshow of Australians on holidays between 1950 and 1989.A pictorial love letter to a somewhat bygone era, it captures the accessible glamour and car-friendly convenience of the road-side motel, from Gold Coast 'palaces' to out-of-the-way comfort stops (some with attached restaurant! Dinner: 6.30-8pm).Motel is an affectionate tribute to one of this country's greatest democratic institutions. From Prime Ministers to punters, at some stage we've all had to lay our head down at a welcoming motel as the sun sets on the highway.

It's easy to make one, lying on your back in the newest snow. You move your arms like wings. Later you forget about your creation, go inside for a mug of hot chocolate. That's when she rises from the snow takes a feathery breath, tries out her wings. So begins a poem about making a snow angel, but it might also refer to the mysterious way that a poem comes into being and takes on a life of its own. In this new collection, Ralph Fletcher shows us how you can write a poem about almost anything: a baby sister, a Venus's-flytrap, a failing grandmother, a squished squirrel, grammar homework, and more. These poems take us inside the creative process as they reveal both the playfulness and the power of poetry. More than anything, they invite us to pick up pen and paper and write some poems of your own.

Recent advances in stem cell biology, nanotechnology and gene therapy have opened new avenues for therapeutics. The availability of molecular therapeutics that rely on the delivery of DNA, RNA or proteins, harnessing enhanced delivery with nanoparticles, and the regenerative potential of stem cells (adult, embryonic or induced pluripotent stem cells) has had a tremendous impact on translational medicine. The chapters in this book

cover a range of strategies for molecular and cellular therapies for human disease, their advantages, and central challenges to their widespread application. Potential solutions to these issues are also discussed in detail. Further, the book addresses numerous advances in the field of molecular therapeutics that will be of interest to the general scientific community. Lastly, the book provides specific examples of disease conditions for which these strategies have been transferred to the clinic. As such, it will be extremely useful for all students, researchers and clinicians working in the field of translational medicine and molecular therapeutics.

A deeply reflective primer on creating meaningful connections, rebuilding abundant communities, and living in a way that engages our full humanity in an age of unprecedented anxiety and loneliness—from the author of *The Tech-Wise Family* “Andy Crouch shows the path to reclaiming a life that restores the heart of what it means to thrive.”—Arthur C. Brooks, #1 New York Times bestselling author of *From Strength to Strength* Our greatest need is to be recognized—to be seen, loved, and embedded in rich relationships with those around us. But for the last century, we’ve displaced that need with the ease of technology. We’ve dreamed of mastery without relationship (what the premodern world called magic) and abundance without dependence (what Jesus called Mammon). Yet even before a pandemic disrupted that quest, we felt threatened and strangely out of place: lonely, anxious, bored amid endless options, oddly disconnected amid infinite connections. In *The Life We’re Looking For*, bestselling author Andy Crouch shows how we have been seduced by a false vision of human flourishing—and how each of us can fight back. From the social innovations of the early Christian movement to the efforts of entrepreneurs working to create more humane technology, Crouch shows how we can restore true community and put people first in a world dominated by money, power, and devices. There is a way out of our impersonal world, into a world where knowing and being known are the heartbeat of our days, our households, and our economies. Where our vulnerabilities are seen not as something to be escaped but as the key to our becoming who we were made to be together. Where technology serves us rather than masters us—and helps us become more human, not less.

Forensic science is the application of a broad spectrum of sciences to answer questions of interest to the legal system. Forensic science uses highly developed technologies to uncover scientific evidence in a variety of fields. The word forensic comes from the Latin word forensic (meaning “public”) and currently means “used in or suitable to courts of judicature or to public discussion or debate.” Forensic science is science used in public, in a court or in the justice system; so any science, used for the purposes of the law, is a forensic science. The Eureka legend of Archimedes (287 to 212 B.C.E.) can be considered an early account of the use of forensic science. By examining the principles of water displacement, Archimedes was able to prove that a crown was not made of gold (as it had been claimed) by its density and buoyancy. The use of fingerprints as a means to establish identity occurred during the seventh century. The use of medical evidence to determine the mode of death began as early as the 11th century in China and flourished in 16th-century Europe. The combination of a medical and legal approach to dealing with crimes used in the United States today had its origin in England in the 12th century, when King Richard I established the Office of the Coroner. The American colonists instituted the coroner system, which still exists today. There is no federal law requiring a coroner to be a licensed physician. Modern forensic science has a broad range of applications. It is used in civil cases such as forgeries, fraud or negligence. It can help law enforcement officials determine whether any laws or regulations have been violated in the marketing of foods and drinks, the manufacture of medicines or the use of pesticides on crops. It also can determine whether automobile emissions are within a permissible level and whether drinking water meets legal purity requirements. Forensic science is used in monitoring the compliance of various countries with such international agreements as the Nuclear Non-Proliferation Treaty and the Chemical Weapons Convention and to learn whether countries are developing secret nuclear weapons programs. However, forensic science most commonly is used to investigate criminal cases involving a victim, such as assault, robbery, kidnapping, rape or murder. The medical examiner is the central figure in an investigation of crimes involving victims. It is the responsibility of the medical examiner to visit the crime scene, conduct an autopsy (an examination of the body) in cases of death, examine the medical evidence and laboratory reports, study the victim's medical history and put all that information together in a report to the district attorney, the public prosecuting officer within a defined district. Medical examiners usually are physicians specializing in forensic pathology, the study of structural and functional changes in the body as a result of injury. The medical examiner may call upon forensic scientists, who are specialists in these various fields for help investigating a crime. In criminal cases, forensic scientists often are involved in the search for and examination of physical traces that may be useful for establishing or excluding an association between someone suspected of committing a crime and the scene of the crime or victim. Such traces commonly include blood, other body fluids, hair, textile fibers from clothing, paint, glass, other building materials, footwear, tool and tire marks and flammable substances used to start fires. Sometimes the scientist will visit the scene itself to advise about the likely sequence of events and to join in the initial search for evidence. Other forensic scientists called toxicologists analyze a person’s bodily fluids, tissue and organs for drugs, poisons, alcohol and other substances. Yet others specialize in firearms, explosives or documents whose authenticity is questioned. One of the oldest techniques of forensic science is dusting the scene of a crime for fingerprints. Because no two fingerprints are the same, fingerprinting provides a positive means of identification. Computer technology now allows law enforcement officers to record fingerprints digitally and to transmit and receive fingerprint information electronically for rapid identification. DNA fingerprinting provides an excellent way to analyze blood, hair, skin or semen evidence found at the crime scene. By using an advanced technology method known as the polymerase chain reaction (PCR), a laboratory rapidly can clone, or multiply, the DNA from a tiny sample of any of these substances. This process produces enough DNA to compare with a sample of DNA taken from a suspected criminal. Forensic science today is a high-technology field using electron microscopes, lasers, ultraviolet and infrared light, advanced analytical chemical techniques and computerized databanks to analyze and

research evidence. For example, blood-alcohol levels can be determined by actual blood tests, usually through gas chromatography. In this method, the blood sample is vaporized by high temperature and the gas is sent through a column that separates the various chemical compounds present in the blood. Gas chromatography permits the detection not only of alcohol but also of other drugs, such as barbiturates, cocaine, amphetamines and heroin. When a body is discovered in a lake, stream, river or ocean and the lungs are found to be filled with water, the medical examiner must determine if the drowning occurred where the body was found or elsewhere. A standard microscope that can magnify objects to 1,500 times their actual size is used to look for the presence or absence of diatoms, single-celled algae that are found in all natural bodies of water. The absence of diatoms raises the possibility that the drowning took place in a sink or bathtub, not where the body was found, since diatoms are filtered from household water during treatment. A scanning electron microscope that can magnify objects 100,000 times is used to detect the minute gunpowder particles present on the hand of a person who recently has fired a gun. These particles also can be analyzed chemically to identify their origin from a particular type of bullet. Forensic examination of substances found at a crime scene often can establish the presence of the suspect at the scene. Human bite marks also can serve as circumstantial evidence. Such bites may be found upon the body of a homicide victim or within pieces of food or other objects found at the crime scene, such as chewing gum. A forensic scientist can fill the impressions caused by these bites with liquid plastic. Upon hardening, the cast formed is an extremely accurate replica of the assailant’s teeth, which can be compared with a cast made from the teeth of the suspect.
