'One of the best books yet written on data and algorithms. . .deserves a place on the bestseller charts.' (The Times)
You are accused of a crime. Who would you rather determined your fate - a human or an algorithm? An algorithm is more consistent and less prone to error of judgement. Yet a human can look you in the eye before passing sentence.

Welcome to the age of the algorithm, the story of a not-too-distant future where machines rule supreme, making important decisions - in healthcare, transport, finance, security, what we watch, where we go even who we send to prison. So how much should we rely on them? What kind of future do we want? Hannah Fry takes us on a tour of the good, the bad and the downright ugly of the algorithms that surround us. In Hello World she lifts the lid on their inner workings, demonstrates their power, exposes their limitations, and examines whether they really are an improvement on the humans they are replacing. Foundations for Designing User-Centered Systems introduces the fundamental human capabilities and characteristics that influence how people use interactive technologies. Organized into four main areas—anthropometrics, behaviour, cognition and

social factors—it covers basic research and considers the practical implications of that research on system design. Applying what you learn from this book will help you to design interactive systems that are more usable, more useful and more effective. The authors have deliberately developed *Foundations for Designing User-Centered Systems* to appeal to system designers and developers, as well as to students who are taking courses in system design and HCI. The book reflects the authors' backgrounds in computer science, cognitive science, psychology and human factors. The material in the book is based on their collective experience which adds

up to almost 90 years of working in academia and both with, and within, industry; covering domains that include aviation, consumer Internet, defense, eCommerce, enterprise system design, health care, and industrial process control.

: The market of mobile
technologies is growing
at an enormous rate
worldwide. With the
latest developments in
technology, new
services are being
invented which were
not even possible some
years ago. As new
devices, applications
and services emerge,
also the number of
mobile users is
increasing in a rapid
manner. Mobile
broadband networks
like UMTS, EDGE or
Wireless LAN make it
possible to reach a
large group of users

who gain access with
their personal mobile
devices, equipped with
multimedia and data
capabilities. Due to this
development, new
interesting possibilities
arise for many areas.
One of these areas is
the tourism sector,
which is being referred
to in this thesis. The so-
called m-tourism
(mobile tourism) is an
emerging field with an
enormous marketing
potential, as described
in Chapter 2. Recent
hardware inventions
and developments are
greatly pushing the
market share.
Companies are offering
tailored products filling
the needs of their
customers.
Personalization of
services becomes a

popular trend in this sector. But what do users think about such a mobile tourism service? Do they feel the service has added benefits, compared to traditional media and Web-based services? Are those products really user friendly? What would be the crucial applications and qualities that make the big difference ? A range of usability issues concerning mobile services is being discussed in the science community; are there already viable, good solutions? With the recent hype of so-called location based services, the consumer keeps calling for more usable products, featuring more intuitive

interfaces. Others may fear being overwhelmed with features. Especially for the senior users, a relatively big target group for most mobile applications, these products often remain a mystery. Usability has been and should always remain a key element for quality software and successful applications. In this thesis, several applications are described, some of their user interfaces are analyzed and major flaws discovered. Furthermore, a corresponding prototype user interface is introduced with a specific analysis of each development step, taken from the book *The Usability*

Engineering Lifecycle by Deborah J. Mayhew. Once prototypical realisations are available, users can validate the implemented approaches and evaluate concepts and realization details from their point of view. Such first user experiences are a valuable guidance for further [...]
