Chronic pain costs the nation up to

\$635 billion each year in medical treatment and lost productivity. The 2010 Patient Protection and Affordable Care Act required the Department of Health and Human Services (HHS) to enlist the Institute of Medicine (IOM) in examining pain as a public health problem. In this report, the IOM offers a blueprint for action in transforming prevention, care, education, and research, with the

goal of providing relief for people with pain in America. To reach the vast multitude of people with various types of pain, the nation must adopt a population-level prevention and management strategy. The IOM recommends that HHS develop a comprehensive plan with specific goals, actions, and timeframes. Better data are needed to help shape efforts, especially on the groups of people currently

underdiagnosed and undertreated, and the IOM encourages federal and state agencies and private organizations to accelerate the collection of data on pain incidence, prevalence, and treatments. Because pain varies from patient to patient, healthcare providers should increasingly aim at tailoring pain care to each person's experience, and self-management of pain should be promoted. In addition, because there are major gaps in knowledge about pain across health care and society alike, the IOM recommends that federal agencies and other stakeholders redesign education programs to bridge these gaps. Pain is a major driver for visits to physicians, a major reason for taking medications, a major cause of disability, and a key factor in quality of life and productivity. Given the burden of pain in human lives, dollars, and social consequences, relieving pain should be a national priority.

### **Assessment and Multimodal Management of Pain** Hpnna Palliative Nursing Manual

This updated and revised version of Eltringham's "Post Anaesthetic Recovery" contains sections each devoted to the current best practice in a particular area. It describes the major problems that may be encountered during recovery from anaesthesia and suggests how they may be avoided by careful monitoring, vigilant nursing and sound organization. Post-Operative Recovery and Pain Relief will thus be of interest not only to nursing staff working in operating theatres and post-

operative care units, but also to those working in surgical units, house officers and junior anaesthetists.

Oxford Textbook of Pediatric Pain Oxford University Press

BackgroundUp to 70% of cancer patients experience pain during their course of illness.[1] Studies showed that 40-50% of patients with cancer pain receive insufficient analgesia due to different factors.

Physicians are facing different challenges to accurately assess pain which might affect drug selection and pain control.[2,3,4] In the National Center for Cancer Care Research (NCCCR), treating physicians may prescribe analgesics to their patients or refer them to the Pain Management Service (PMS) based on their evaluation or as requested by patients. ObjectivesThis study was conducted to assess the existing PMS at NCCCR from patients' perspective. It explored the factors which might lead to under-treatment of cancer pain in Qatar. In addition, it focused on cancer patientsu2019 pain management satisfaction and PMS awareness. MethodsIn this study, we evaluated patientsu2019 pain management perceptions via a validated written -Arabic English- questionnaire (SF-MPQ-2). [5,6] A structured interview by Outpatient Pharmacists was conducted at a single point of time to assess if patients are aware of the PMS or not, if they are receiving pain medications or not, if they are

experiencing any pain regardless on pain medications or not, their pain severity, and their level of satisfaction with their treatment. A sample of patients was randomly selected from the total cancer population visiting NCCCR Pharmacy over a specific period of time. Patients who agreed to participate were consented and interviewed. Results A total of 400 patients agreed to participate; their median age was 50 and male to female ratio was 3:7. Results showed that 61% (245/400) of participants were not aware of the existence of PMS. Only 20% (78/400) were aware and followed by PMS, with a satisfaction rate of 76% (59/78). Although 69% (276/400) of patients were on pain medications, more than 30% (85/276) of them were not satisfied with their treatment. From the 191 (69%) satisfied patients, 57% rated their pain as 4-10 at the time of interview. From the 124 (31%) patients that were not on pain medications, 77% did not know about the PMS and 44% had 4-10 pain severity. Conclusion Our findings showed that factors leading to under-treating of cancer pain in Qatar might be; unawareness of the PMS existence, pain treatment by non-specialized physicians, and patients' reluctance to express their pain. Thus, raising patient awareness and standardizing the referral criteria can improve pain control and quality of life among cancer patients with pain. References 1.
