*Transportation Energy Data Book* Vintage

From the acclaimed author of *The Pencil* and *To Engineer Is Human*, *The Essential Engineer* is an eye-opening exploration of the ways in which science and engineering must work together to address our world's most pressing issues, from dealing with climate change and the prevention of natural disasters to the development of efficient automobiles and the search for renewable energy sources. While the scientist may identify problems, it falls to the engineer to solve them. It is the inherent practicality of engineering, which takes into account structural, economic, environmental, and other factors that science often does not consider, that makes engineering vital to answering our most urgent concerns. Henry Petroski takes us inside the research, development, and debates surrounding the most critical challenges of our time, exploring the feasibility of biofuels, the progress of battery-operated cars, and the question of nuclear power. He gives us an in-depth investigation of the various options for renewable energy—among them solar, wind, tidal, and ethanol—explaining the benefits and risks of each. Will windmills soon populate our landscape the way they did in previous centuries? Will synthetic trees, said to be more efficient at absorbing harmful carbon dioxide than real trees, soon dot our prairies? Will we construct a "sunshade" in outer space to protect ourselves from dangerous rays? In many cases, the technology already exists. What's needed is not so much invention as engineering. Just as the great achievements of centuries past—the steamship, the airplane, the moon landing—once seemed beyond reach, the solutions to the twenty-first century's problems await only a similar coordination of science and engineering. Eloquent and well-reasoned, *The Essential Engineer* identifies and illuminates these problems—and, above all, sets out a course for putting ideas into action.

This collaborative study between the NRC and the Chinese Academy of Engineering (CAE) addresses the problems facing China in the next twenty years as it attempts to provide personal transport desired by millions of Chinese, while preserving the environment and the livability of its cities. According to Song Jian, president of the CAE, the decision has already been taken to produce a moderate cost family car in China, which will greatly increase the number of vehicles on the roads. This study explores the issues confronting the country, including health issues, the challenge to urban areas, particularly the growing number of megacities, environmental protection, infrastructure requirements, and technological options for Chinese vehicles. It draws on the experience of the United States and other countries and review model approaches to urban transportation and land use planning. Recommendations and policy choices for China are described in detail.
